CITY OF CRANBROOK GROWTH MANAGEMENT STUDY
- VOL. 2 TRANSPORTATION PLANNING REPORT

Table of Contents

1.0 Introduction

1.1 BACKGROUND

As the regional service centre of the Kootenays, the City of Cranbrook is approaching a current population of approximately 20,000. Recognizing the importance and necessity to plan and design the future transportation system, the City has requested preparation of a transportation planning model as one major component of the City of Cranbrook Growth Management Study - Transportation Planning Section.

1.2 STUDY OBJECTIVES

The following are the main objectives of this transportation planning study:

- Review existing traffic operations, collect traffic counts at major/critical intersections
- Review existing transportation system, including transit, bicycle/pedestrian trail, rail and air transportation system
- Assess the current major roadway network, prepare a fully calibrated computerized base year transportation model
- Apply the Base Year model to future horizons, perform travel demand forecasting
- Evaluate the major roadway network required for a short term horizon (10 year) and longer term horizons (e.g. full build out of current City boundary).
- Prepare conceptual cost estimate at planning level

1.3 BACKGROUND MATERIALS

For this study, the following background materials were collected and reviewed:

- Cranbrook Official Community Plan (2006) and its update
- Cranbrook Subdivision Servicing and Development Control Bylaw (1994)
- Cranbrook Zoning Bylaw (1994)
- Cranbrook roads record drawings

2.0 Existing Transportation System

As part of the study, the existing transportation systems including roadways, transit service, trail system, as well as rail and air transportation were reviewed. The key findings and the characteristics of each system were summarized below.

2.1 EXISTING ROADWAY SYSTEM

2.1.1 Roadway Functional Classification

The two main functions of a roadway are to provide mobility and land access. These two functions typically compete with each other, and a hierarchical functional classification for roadways is often used for transportation planning and design purposes.

The functional classification most commonly used is defined in the Transportation Association of Canada (TAC) "*Geometric Design for Canadian Roads*". They include:

- Highway / Expressway
- Highway Connector
- Arterial
- Collector
- Local

The following paragraphs provide a brief description of the function and typical characteristics of these roadway classifications.

Highway / Expressway

A highway or expressway's principal function is to provide for through traffic movements and to accommodate longer distance trips. Few access points are permitted to an expressway and often these only provide grade separated interchange. In and close to urban areas, traffic volumes on an expressway often exceed 20,000 vehicles per day.

Although the current daily traffic volumes along Highway 3/95 and Highway 95A in the context of Cranbrook are within 10,000 veh/day, based on the road characteristics Highway 3/95 and Highway 95A are still categorized into Highway / Expressway classification.

Highway Connector

A Highway Connector provides a link through the city between external highways, like Cranbrook Street and Van Horne Street in Cranbrook.

Arterial

An arterial roadway provides for traffic movement and connects the principal areas of traffic generation in community. Ideally, only other arterial or collector roadway should intersect with an arterial. Intersections, typically at a minimum spacing of 400 metres, are usually controlled by means of traffic signals, or in special circumstances by grade separated interchanges. Preferably, arterials provide no direct access to adjacent developments and parking is generally not permitted. Traffic volumes on arterials usually vary between 10,000 and 30,000 vehicles per day, but can be substantially higher.

Collector

Collector roadways place roughly equal emphasis on mobility and land access. In general, collector roadways provide a link for traffic to travel from a local road to the nearest arterial roadway. They are intended to accommodate most of the traffic movements within a neighbourhood and often serve as bus routes. Average traffic volumes on a collector typically range between 1,000 and 12,000 vehicles per day. In residential areas, traffic volumes are usually kept below 5,000 to 6,000 vehicles per day. Parking is usually permitted on collector roadways.

Local

A Local roadway's primary function is to provide direct access to abutting land uses. Through traffic and bus routes on these roadways are not considered desirable and traffic volumes are typically kept below 1,000 vehicles per day. Parking is usually permitted on local roadways.

2.1.2 Existing Roadway Characteristics

Cranbrook has defined its own simple roadway classification, which includes provincial highway, major road and other (minor) road. A comparison table with TAC guidelines is shown below.

Table 2.1
City of Cranbrook Roadway Classification

City's Roadway Classification	TAC Comparable Classification
Provincial Highway	Highway / Expressway and Highway Connector
Major Road	Arterial and Collector
Other (Minor) Road	Local

The existing roadway network and roadway classification in Cranbrook is shown in Figure 2.1.

Existing Roadway Network and Roadway Classification

April 2009
1127 20147

2.1.3 Existing Traffic Volumes

Planning of roadway facilities is usually done on the basis of weekday traffic volumes. However, weekend and special event volumes may be considered in special cases.

To identify existing traffic, a total of 24 intersection peak hour turning movement counts and 11 automatic traffic recorder (ATR) counts were collected by TransTech Data Service in June 2008. A summary of these counts is contained in Appendix A. In addition, a number of counts along Highway 3/95 and Highway 95A were obtained from Ministry of Transportation and Infrastructure (MoT) website.

The 7 day ATR counts completed by TransTech and MoT were reviewed to determine variations in the traffic pattern over the period of a day and a week. In general, mid-week traffic volumes most closely approximate the average weekday traffic volumes. Daily traffic on Fridays are typically 10% higher than the average weekday traffic volumes, while daily traffic volumes on Monday are typically 10% lower than the average weekday traffic volumes.

During the weekday, Monday to Friday, three peak periods occur usually between the hours of 0700 to 0900 (AM), 1130 to 1330 (Noon) and 1600 to 1800 (PM). In most cities, the PM peak period has the highest traffic volumes and is used for both roadway and traffic signal design. Therefore, the PM Peak hour was the selected scenario for model analysis. While the PM peak hour traffic volume as a percentage of the total daily volume varies depending on the location of the count, on average it represents 8 to 10% of the daily traffic volume. As such, daily volumes were projected by multiplying PM peak hour traffic volumes by 11 (i.e. the inverse of 9%).

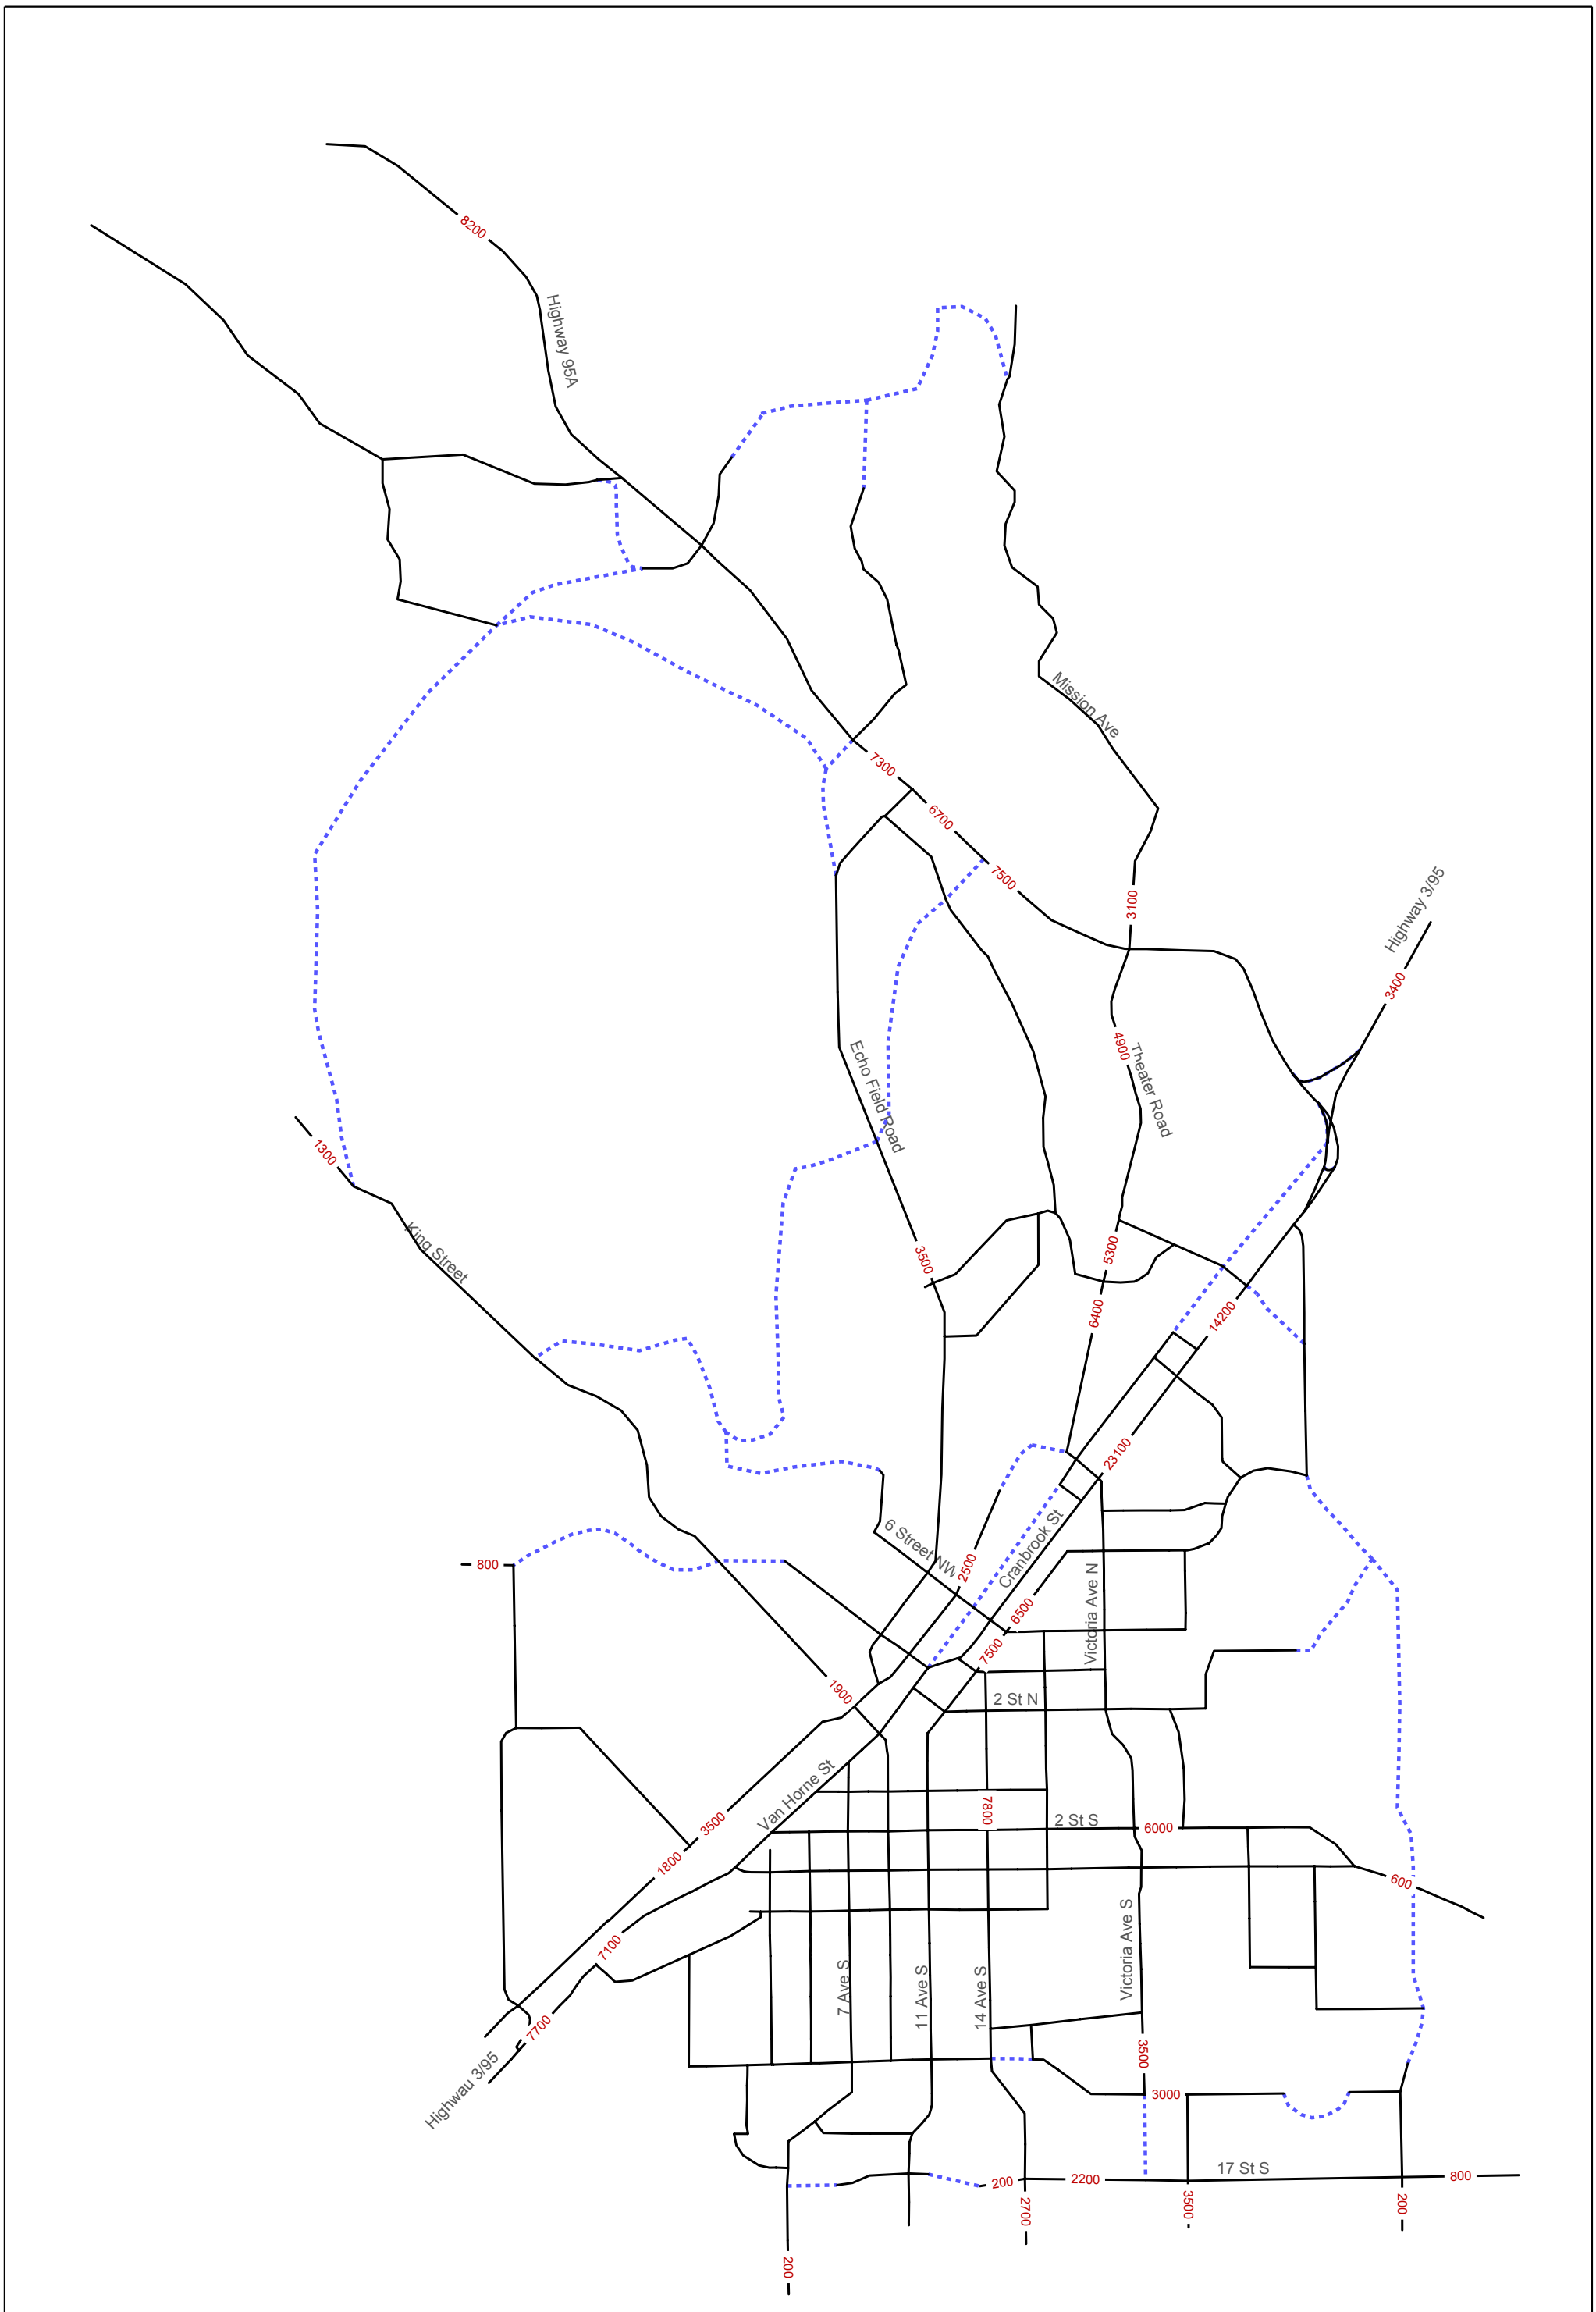
The existing Daily traffic volumes on key roads either collected by the ATR counts or scaled based on the PM peak hour counts are shown in Figure 2.2.

2.1.4 Definition of Roadway Capacity

Link capacity is influenced by many factors. The most important of these factors is the motorist's perception of an acceptable amount of congestion and delay. The amount of congestion or delay is typically defined by the concept of a volume to capacity (V/C) ratio. The V/C ratio is a percentage that indicates the amount of capacity being utilized by the traffic volume.

In larger cities, such as Vancouver and Calgary, motorists commonly experience delays and congestion and have come to accept them. Typically, roadway network improvements are usually not initiated until a V/C of 90% or higher is reached. In smaller cities, such as Cranbrook, motorist expectations typically are for higher levels of service. The consultation with the City of Cranbrook Engineering Department as well as the consultant's experience from other similar sized cities indicate that motorists in Cranbrook typically will not accept worse than a V/C of 70% before they begin to express dissatisfaction.

Table 2.2 outlines general characteristics of traffic in an urban environment for various levels of service.



VISUM 11.02 PTV AG	Fig 2.2 - Cranbrook Existing Daily Traffic Volumes	cranbrook_base year.ver
Date: 03.02.2010	Stantec Consulting Ltd.	Scale: 1:30000

Table 2.2
Level of Service Characteristics

Level of Service	Overall Volume Capacity	Characteristics
A	<0.60	Free Flow; low volumes and high speeds most drivers can select own speed.
B	0.60 to 0.69	Stable flow; speed restricted slightly by traffic
C	0.70 to 0.79	Stable flow; speed controlled by traffic.
D	0.80 to 0.89	Approaching unstable flow; low speed.
E	0.90 to 0.99	Unstable flow; low, varying speeds, volumes at or near capacity.
F	≥ 1.0	Forced flow; low speed; volume below capacity; stoppages.

2.1.5 Existing Level of Service

The City of Cranbrook has a relatively well developed roadway network with a highway handling major traffic. Due to a small size community but with this well developed road network, all sections of the roadway network within the City's jurisdiction function at level of service (LOS) of "B" or better under normal traffic operations (e.g. railway trains are not crossing/occupying the City roadways and blocking the adjacent intersections).

Stantec conducted a site visit during June 24 to 26, 2008. The site observation confirms the above conclusion.

2.2 EXISTING TRANSIT SYSTEM

At time of this study, the City of Cranbrook Transit System provides an integrated transit system that allows riders convenience and flexibility travelling within the city. In addition, Kimberley Transit System provides inter-city service to/from Cranbrook with three round trips on every Tuesday and Thursday.

Currently, four types of accessible transit services are provided in the City. They are:

- **Conventional Transit Service**

The conventional transit service in Cranbrook started in December 2000. As shown in Figure 2.3, the existing conventional transit system includes 6 fixed transit routes. From Monday to Saturday the conventional buses run from 7:45 am to 9:40 pm. On Sundays they run from 9:45 am to 5:45 pm. The buses do not run on most holidays.

Client/Project
City of Cranbrook Growth Management Study - Transportation Planning

Figure No. 2.3

Title
Conventional Transit System

April 2009
1127 20147

❖ **HandyDART**

HandyDART, starting in 1982 as a paratransit system, is a fully accessible door-to-door service for those residents who are unable to use the conventional fixed-route system. Both the conventional transit service and handyDART transit system are currently operated by Greyhound of Canada Corporation.

❖ **Taxi Saver Program**

The Taxi Saver Program provides registered handyDART passengers with subsidized taxi service, giving them the flexibility to coordinate their own trips when the handyDART system is unavailable.

❖ **Taxi Supplement Program**

The Taxi Supplement Program enables the handyDART operator to book trips in taxis when the regular vehicle(s) is unavailable, either because of capacity issues or because the trip cannot be accommodated in a timely manner.

In 2004, BC Transit conducted Transit Service Review for Cranbrook Transit System. The summary report has described the City's transit service and proposed some service plan changes.

As indicated in the report as well as in other BC Transit documents, the transit ridership in Cranbrook has increased each year as the system matures. For example, the 2007 Cranbrook transit ridership has increased by 16% as compared with 2006.

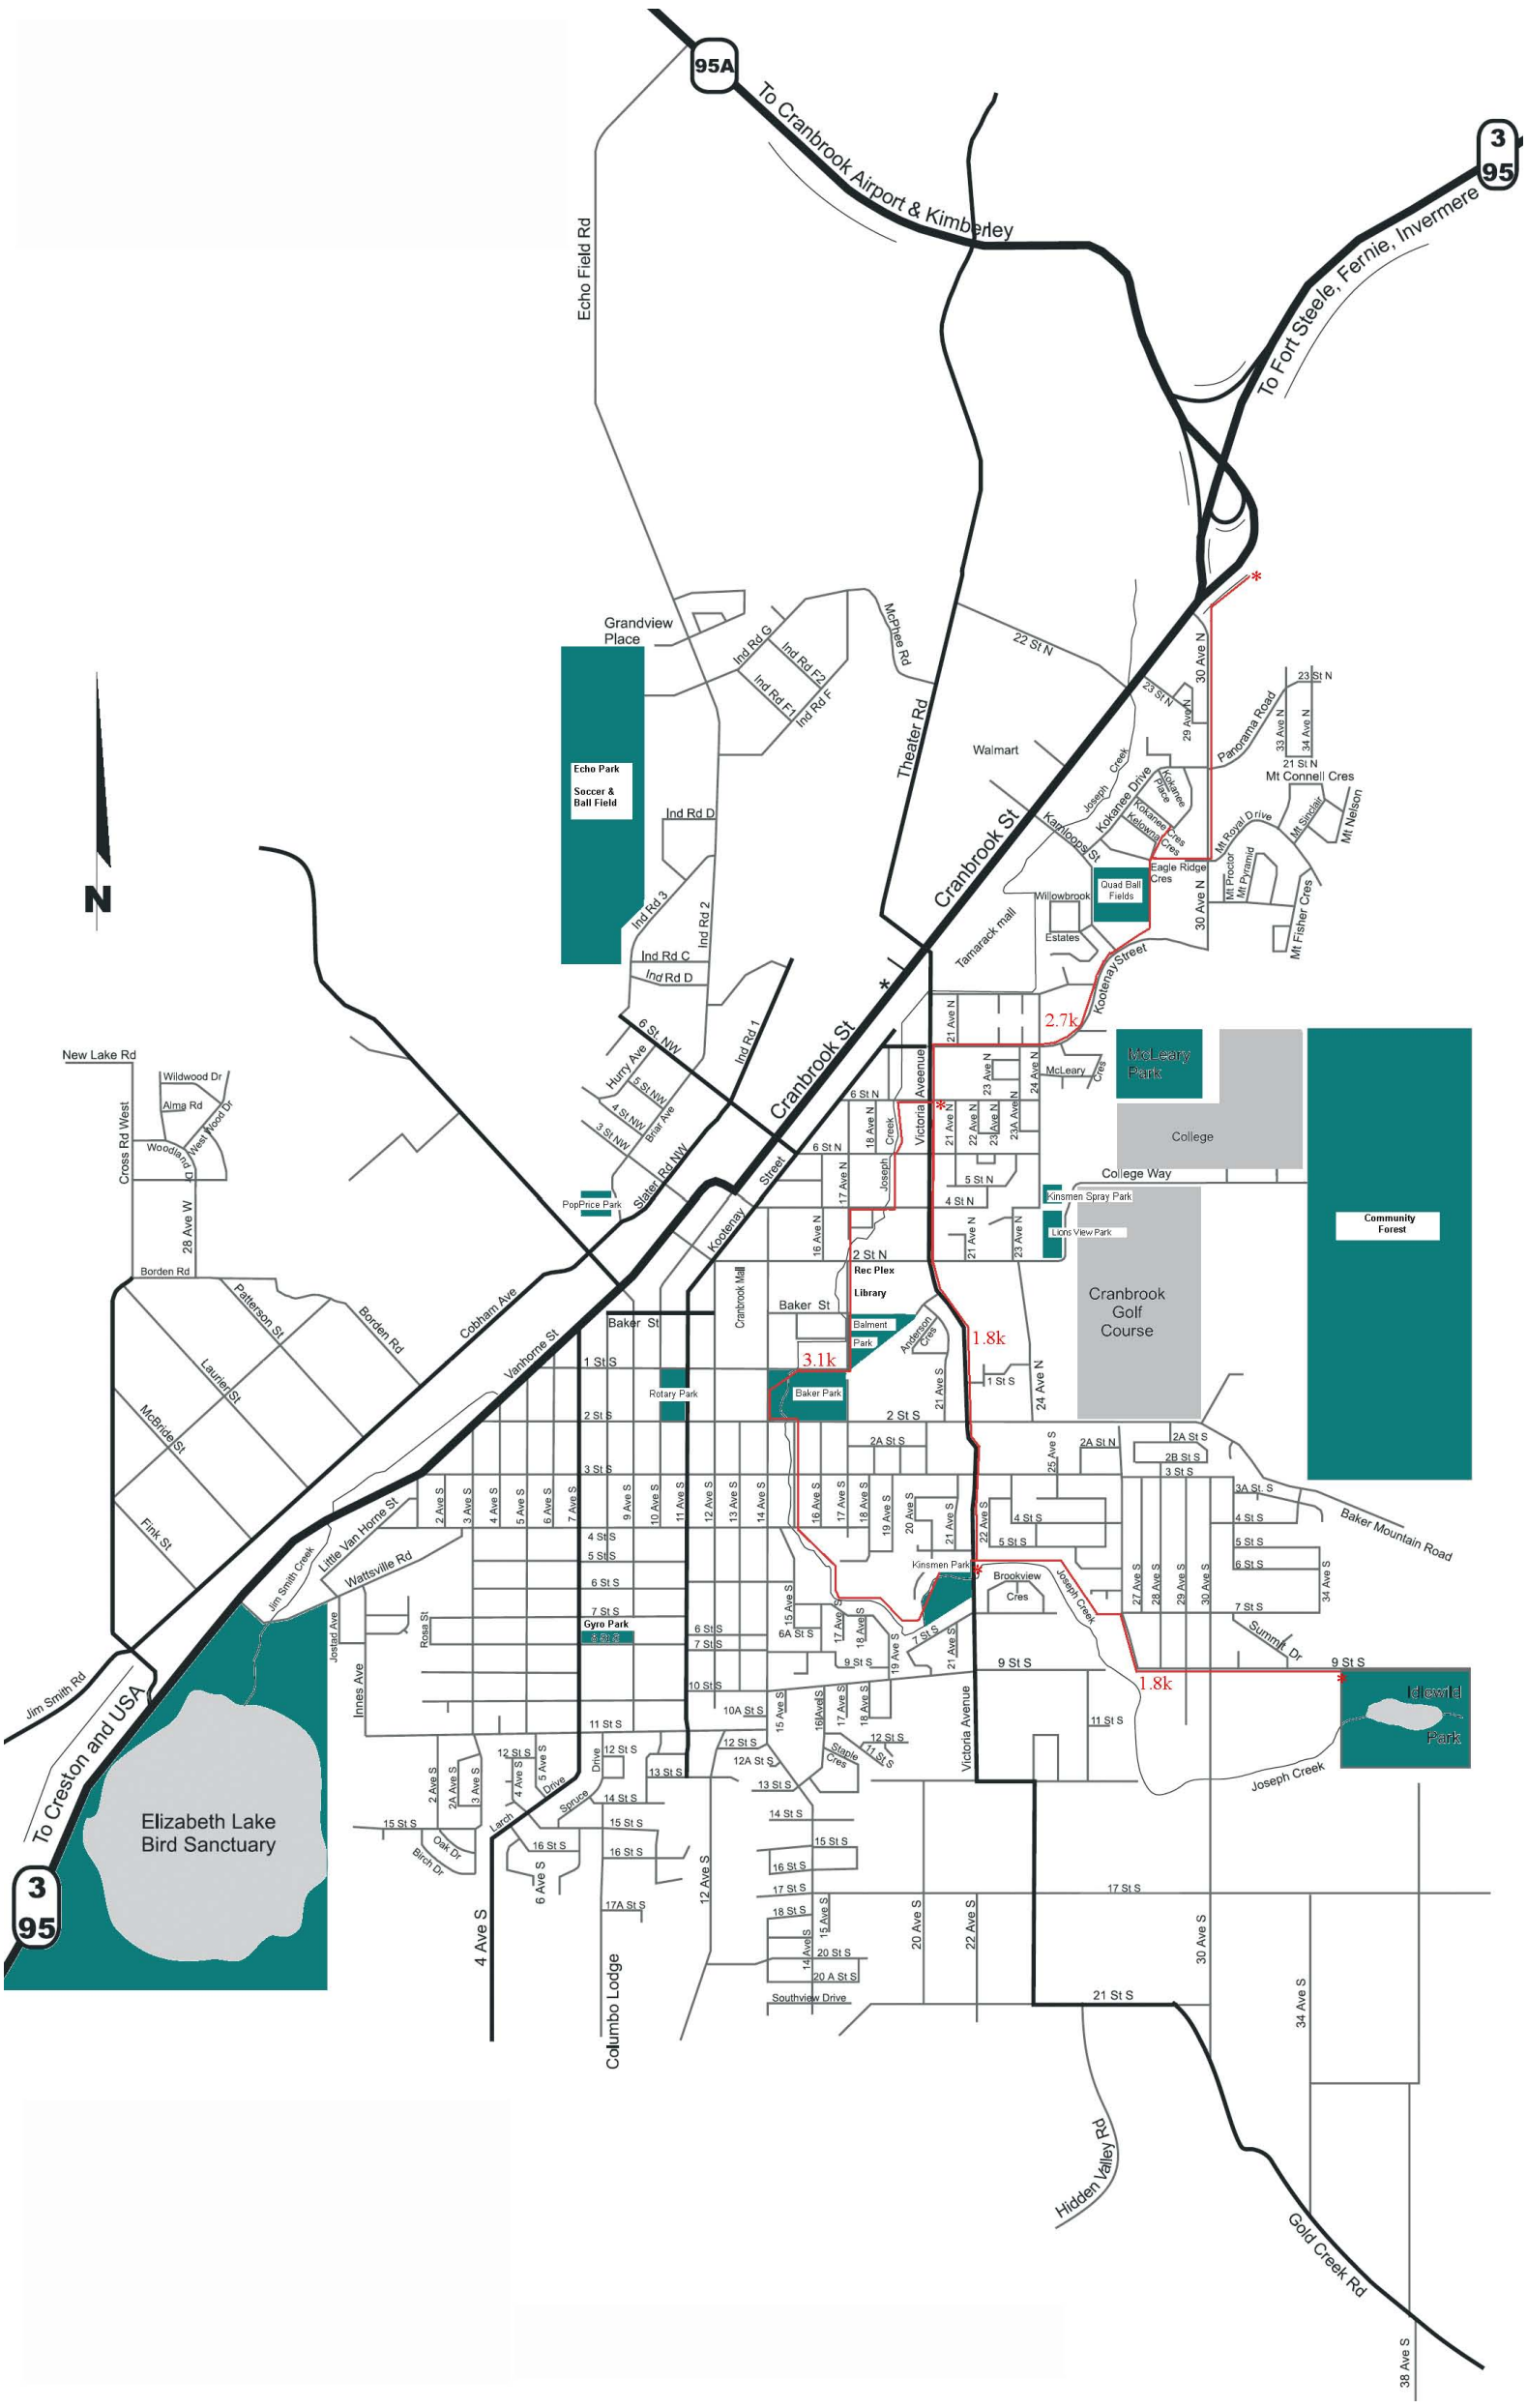
In 2006, Cranbrook was recognized as the smallest transit system in BC to start negotiation of a U-Pass program with Rocky Mountain College.

As shown in Figure 2.3, the majority of the City is within 300 metres of transit service. However it should be noted that no transit service is provided in the area west of the railway line. The Transit Service Review Report has suggested providing morning and afternoon commuter trips for residents working in the light industrial area (west of the railway line), and mid-day transit service for residents living in Grandview Heights and through the Slaterville neighbourhood.

2.3 EXISTING BICYCLE AND PEDESTRIAN SYSTEM

Most roadways in Cranbrook include sidewalks on one or both sides of the carriageway, providing dedicated space for pedestrian traffic. Bicycles, legally defined as vehicles, are accommodated within shared-traffic travel lanes with motorized vehicles. In addition to the core roadway system, pedestrian and bicycle traffic is served by numerous pedway connections (typically linking cul-de-sac or other local roads with nearby major streets).

As shown in Figure 2.4, the existing pedestrian/bicycle recreational trail system within the City connects Idlewild Park at south, and then extends north along 9 Street S and Joseph Creek connecting Kinsmen Park. Thereafter, the trail is split into two north/south trails with one along



Existing Trail

Victoria Avenue, and another along Joseph Creek connecting Baker Park, Balment Park and Recreation Plex. The two split trails join again at Victoria Avenue N with 6 Street N, and continue along Kootenay Street connecting Quad Ball Fields and then further north along 30 Avenue N to Fort Steel Interchange at the north end. The total length of the existing pedestrian/bicycle trails in Cranbrook is about 9.4 km.

2.4 EXISTING RAIL TRANSPORTATION SYSTEM

Cranbrook has been the railway centre of the East Kootenay in British Columbia since the Crowsnest Pass Route was in operation in 1898. Canadian Pacific Railway forms the main lines north and rail spurs run adjacent to the industrial parks. Some rail spurs are available to both private and City property. The current rail system in Cranbrook is illustrated in Figure 2.1.

The main line crosses some major roads in the City, including King Street W, 3 Street NW and 6 Street NW, immediately northwest of Highway 3/95. Due to high traffic volumes in peak hours, it was observed that the train crossing has significant impacts on the traffic at adjacent intersections. Train operations, especially train shunting, occupied the roads for up to 10 minutes, and all the side street turning movements were blocked. Long queues for some high-traffic movements therefore formed.

In order to mitigate the train impacts, optimizing the train operation (e.g. avoid train operation or at least avoid shunting operation in peak hours), and implementing appropriate railway pre-emption measures at impacted highway intersections are recommended.

2.5 EXISTING AIR TRANSPORTATION SYSTEM

Canadian Rockies International Airport is located on Airport Access Road, a short distance off Highway 95A. It is a small regional airport, approximately 9.3 km north of Cranbrook.

As the regional centre of Kootenays and a famous four-season resort destination, Cranbrook attracts visitors all around the world. In 2008, the airport served about 106,000 passengers and had 9,672 aircraft movements.

Currently, Cranbrook has direct connections with Calgary, Vancouver and Salt Lake City via three airline companies (Air Canada, Pacific Coastal Airlines and Delta Air Lines), and through them connecting the rest of the world.

3.0 Base Year Model Structure

Traffic supply and traffic demand are the two key components of a transportation model, which need to be established prior to calibration of the base year model.

- Traffic supply is typically provided by a road network and a transit network. Given that transit use is quite limited in Cranbrook, this model will comprise the road network for modeling auto vehicles only.
- Traffic demand refers to trips/vehicles traveling on a road network. In a transportation model, the population and employment data coded in traffic analysis zones (TAZ) is used to generate traffic. Via zone connectors, the traffic in each zone will then be distributed to the road network.

In order to develop the City of Cranbrook transportation model, VISUM, one of the dominant transportation modeling computer programs was utilized.

3.1 ROAD NETWORK - LINKS

Links are network symbols which connect nodes (to and from) and essentially represent roadways. A link has a particular direction, so that the opposite direction of a link represents a separate network object. As with nodes, links are assigned several attributes such as link number, from/to node number, link type, link length, link speed, link capacity, number of lanes, and permitted transportation mode system (e.g. car, bus, walk, etc.).

A number of user-defined attributes were created in the VISUM model for modeling purposes, including link capacity per lane, 2008 traffic counts, roadway classification, and peak hour design volumes.

The following sections describe several important link attributes in detail.

3.1.1 Link Type

The link type allows the modeler to set up a consistent identification / classification and coding system. In this model, link type mainly reflects its road function / classification based on a number of link characteristics defined, such as link capacity per lane and link speeds.

Figures 3.1 illustrates the link types used for the City of Cranbrook model. A summary table of the link types is shown in Table 3.1.

3.1.2 Link Length / Speed

Link length and speed are used for calculating travel time. In VISUM, link length can be calculated automatically based on the X and Y co-ordinates of the nodes at either end of a link or the intermediate point on curved links.

The posted speed limits along the City roads were used initially as model link speeds. With the model operation, a few modifications to the link speeds were introduced to improve modeling results by ‘tweaking’ the performance of the model. For example, the 60 km/h posted speed limit along Cranbrook Street N and Van Horne Street N (or Highway 3/95 within the City) has been modeled initially and the model results indicated that fewer trips would like to use this major road, as compared with the existing traffic counts. As such, the link speed along this road in the model was increased from 60 km/h to 70 km/h, in order to improve the modeling results.

The modeled link speeds applied to the roadways in the City are illustrated in Figure 3.2.

3.1.3 Link Capacity / Number of Lanes

The capacities used for this model are intended to represent "environmental" capacities as opposed to physical link capacities. An "environmental" capacity is a measure of the amount of traffic that is considered acceptable on a link. For example, in a suburban area, a collector road maybe physically capable of handling traffic flows of up to 1200 vehicles/hour/lane, depending upon the roadway geometry. However, this would not typically be acceptable to the residents of the area or may be perceived as inappropriate levels of congestion by drivers. To avoid the model assigning excessive traffic to the collector roadway due to minor congestion on the adjoining arterial road network, a lower “environmental” capacity is utilized.

Figure 3.3 summarizes the link capacity per lane per hour recommended for the City of Cranbrook Transportation Model.

VISUM 11.02 PTV AG	Figure 3.3 - Cranbrook Transportation Model Network - Link Capacity (Base Year)	cranbrook_base year.ver
Date: 04.02.2010	Stantec Consulting Ltd.	Scale: 1:25000

The capacity of a link is a total directional capacity, and is related to the class of the roadway and the number of lanes. The number of lanes defines how many useable lanes a link has for traffic traveling in each direction and does not include on-street parking lanes. A visual illustration of number of lanes on links comprising the roadway network is contained in Figure 3.4.

3.2 ROAD NETWORK - NODES

Nodes are the start or end points of links, where there are turning movements (called turning relations in VISUM) from one link to another. Each node in the Cranbrook VISUM network represents a street intersection or a physical feature of the road, such as curve or link end.

Each node in the network has several attributes including node number, node type, junction control type, node capacity, and node position in X and Y co-ordinates. Other node user-defined attributes such as K4 (used for node capacity calculation) were created for modeling purposes.

3.2.1 Node Type

Node types are created based on node junction control and classification. For each node type, the value of K4 is assigned to determine node capacity, and a node volume-delay function (VDF) is assigned to calculate node delay.

Table 3.2 summarizes the node types and node descriptions used in the Cranbrook Model. Detailed node junction control types are illustrated in Figure 3.5.

Table 3.2
VISUM Node Information by Type

Type	K4	Node Description
1	1.00	Shape Nodes (uncontrolled)
2	0.50	Two-way Stop Sign Controlled Intersections
3	0.45	Signalized Intersections
4	0.45	All -way Stop Sign Controlled Intersections
5	1.00	Ramp Diverge or Merge

3.2.2 Node Capacity

Each node is assigned a capacity referring to the total amount of traffic that can pass through a node within one hour. Like link capacity, node capacity is used to determine travel delay at nodes, which is discussed in Section 4.3.1.

Node capacity is dependent upon two factors: the intersection control type (i.e., signalized / unsignalized, etc.) and the capacity of the inbound links.

Date: 04.02.2010	Stantec Consulting Ltd.	Scale: 1:30000

VISUM allows the user to code node capacity parameter (K4) which is used together with the total inbound link capacity at a node to determine capacity. The equations used for determining node capacity are expressed as follows:

$$\text{Node Capacity} = K4 * \sum_{i}^{n} (lane_i * lcap_i)$$

where

K4 is user-defined constants, see Table 3.2;

n is the total number of links entering the intersection;

lane$_i$ is the number of lanes of link i entering the intersection; and

lcap$_i$ is the link capacity per lane of the link i entering the intersection.

3.3 TRAFFIC ANALYSIS ZONES

3.3.1 Zone System

A transportation zone system is used to disaggregate the study area into smaller areas for analysis of travel patterns. Generally, a zone system is developed by creating zones with similar land uses, where identifiable physical boundaries and representative access to transportation corridors can be logically defined.

In developing the zone system for Cranbrook, the following documents were reviewed:

- City of Cranbrook Official Community Plan;
- City of Cranbrook zoning bylaw;
- The federal block and dissemination area system used in the 2006 national census.

These plans also identify major physical features and transportation corridors.

The resulting transportation zone system includes a total of 151 zones, which consists of 139 zones within the current city and adjacent area (numbered 1 to 139), and 12 external zones (numbered 1001 to 1012) representing the region outside the study area. The external zones have been assigned to each major access gate around the model boundary to simulate vehicles entering and exiting the model on the surrounding highways and major roadways.

Figure 3.6 illustrates the transportation zones created for the City of Cranbrook transportation model.

3.3.2 Zone Connectors

Zone connectors are used to distribute traffic generated by a zone onto the road network. A zone may have several connectors used for multi-point assignment. The amount of traffic using each connector can be defined by percent share based on land use and access plans.

Future Road Network

VISUM 11.02 PTV AG	Figure 3.6 - Cranbrook Transportation Model Zone System (Base Year)	cranbrook_base year.ver
Date: 04.02.2010	Stantec Consulting Ltd.	Scale: 1:30000

In order to avoid undue influence of zone connectors on major intersections, the zone connectors in this model were not allowed to connect to these major intersections directly. Usually, another intersection or shape node was available to create the connection; alternatively, in some cases a short “dummy” link was created to connect the zone connector.

4.0 Base Year Model Calibration

4.1 GENERAL

Building a transportation planning model with VISUM requires roadway network data as discussed in the previous section. Also required is land use data and a quantified knowledge of the travel characteristics and travel patterns of the residents of the city and the surrounding areas. These requirements include an estimation of population and employment positions, as well as trip generation rates and trip distribution patterns.

The required land use data was obtained in consultation with the City of Cranbrook, and Stantec Urban Planners. The trip generation rates and trip distribution patterns were obtained from the collected turning movement counts, place of residence / place of work commuting data indicated in the 2006 federal census, the Institute of Transportation Engineers (ITE) Trip Generation Manual (7th edition), and Stantec previous similar studies.

4.1.1 Existing Population & Employment

The data presented was disaggregated to match the transportation zone system and input into the transportation model using the following categories:

- residential population;
- retail employment;
- non-retail employment; and
- educational land use (College of The Rockies attendance).

Population Coding

Base year population data was primarily based on the 2006 federal census information. The GeoSearch GIS system in the Statistics Canada's website provides the population and dwelling units information at dissemination block[1] (DB) level.

Stantec reviewed the census data and then aggregated the DB information into the transportation analysis zone level.

Appendix B shows the breakdown of base year population at the Cranbrook traffic analysis zone level. Table 4.1 below illustrates that the base year City population is 18,306, with a total population of 19,189 residing in the model boundary area.

[1] A dissemination block (DB) is an area bounded on all sides by roads and/or boundaries of standard geographic areas. The dissemination block is the smallest census geographic area for which population and dwelling counts are disseminated.

Table 4.1
Base Year Population and Employment

Jurisdiction	Population	Non-home Based Employment Positions	Employment / Population Ratio
City of Cranbrook	18,306	9,589	0.52
Outside the City	883	128	0.14
Total Study Area	19,189	9,717	0.51

Employment Coding

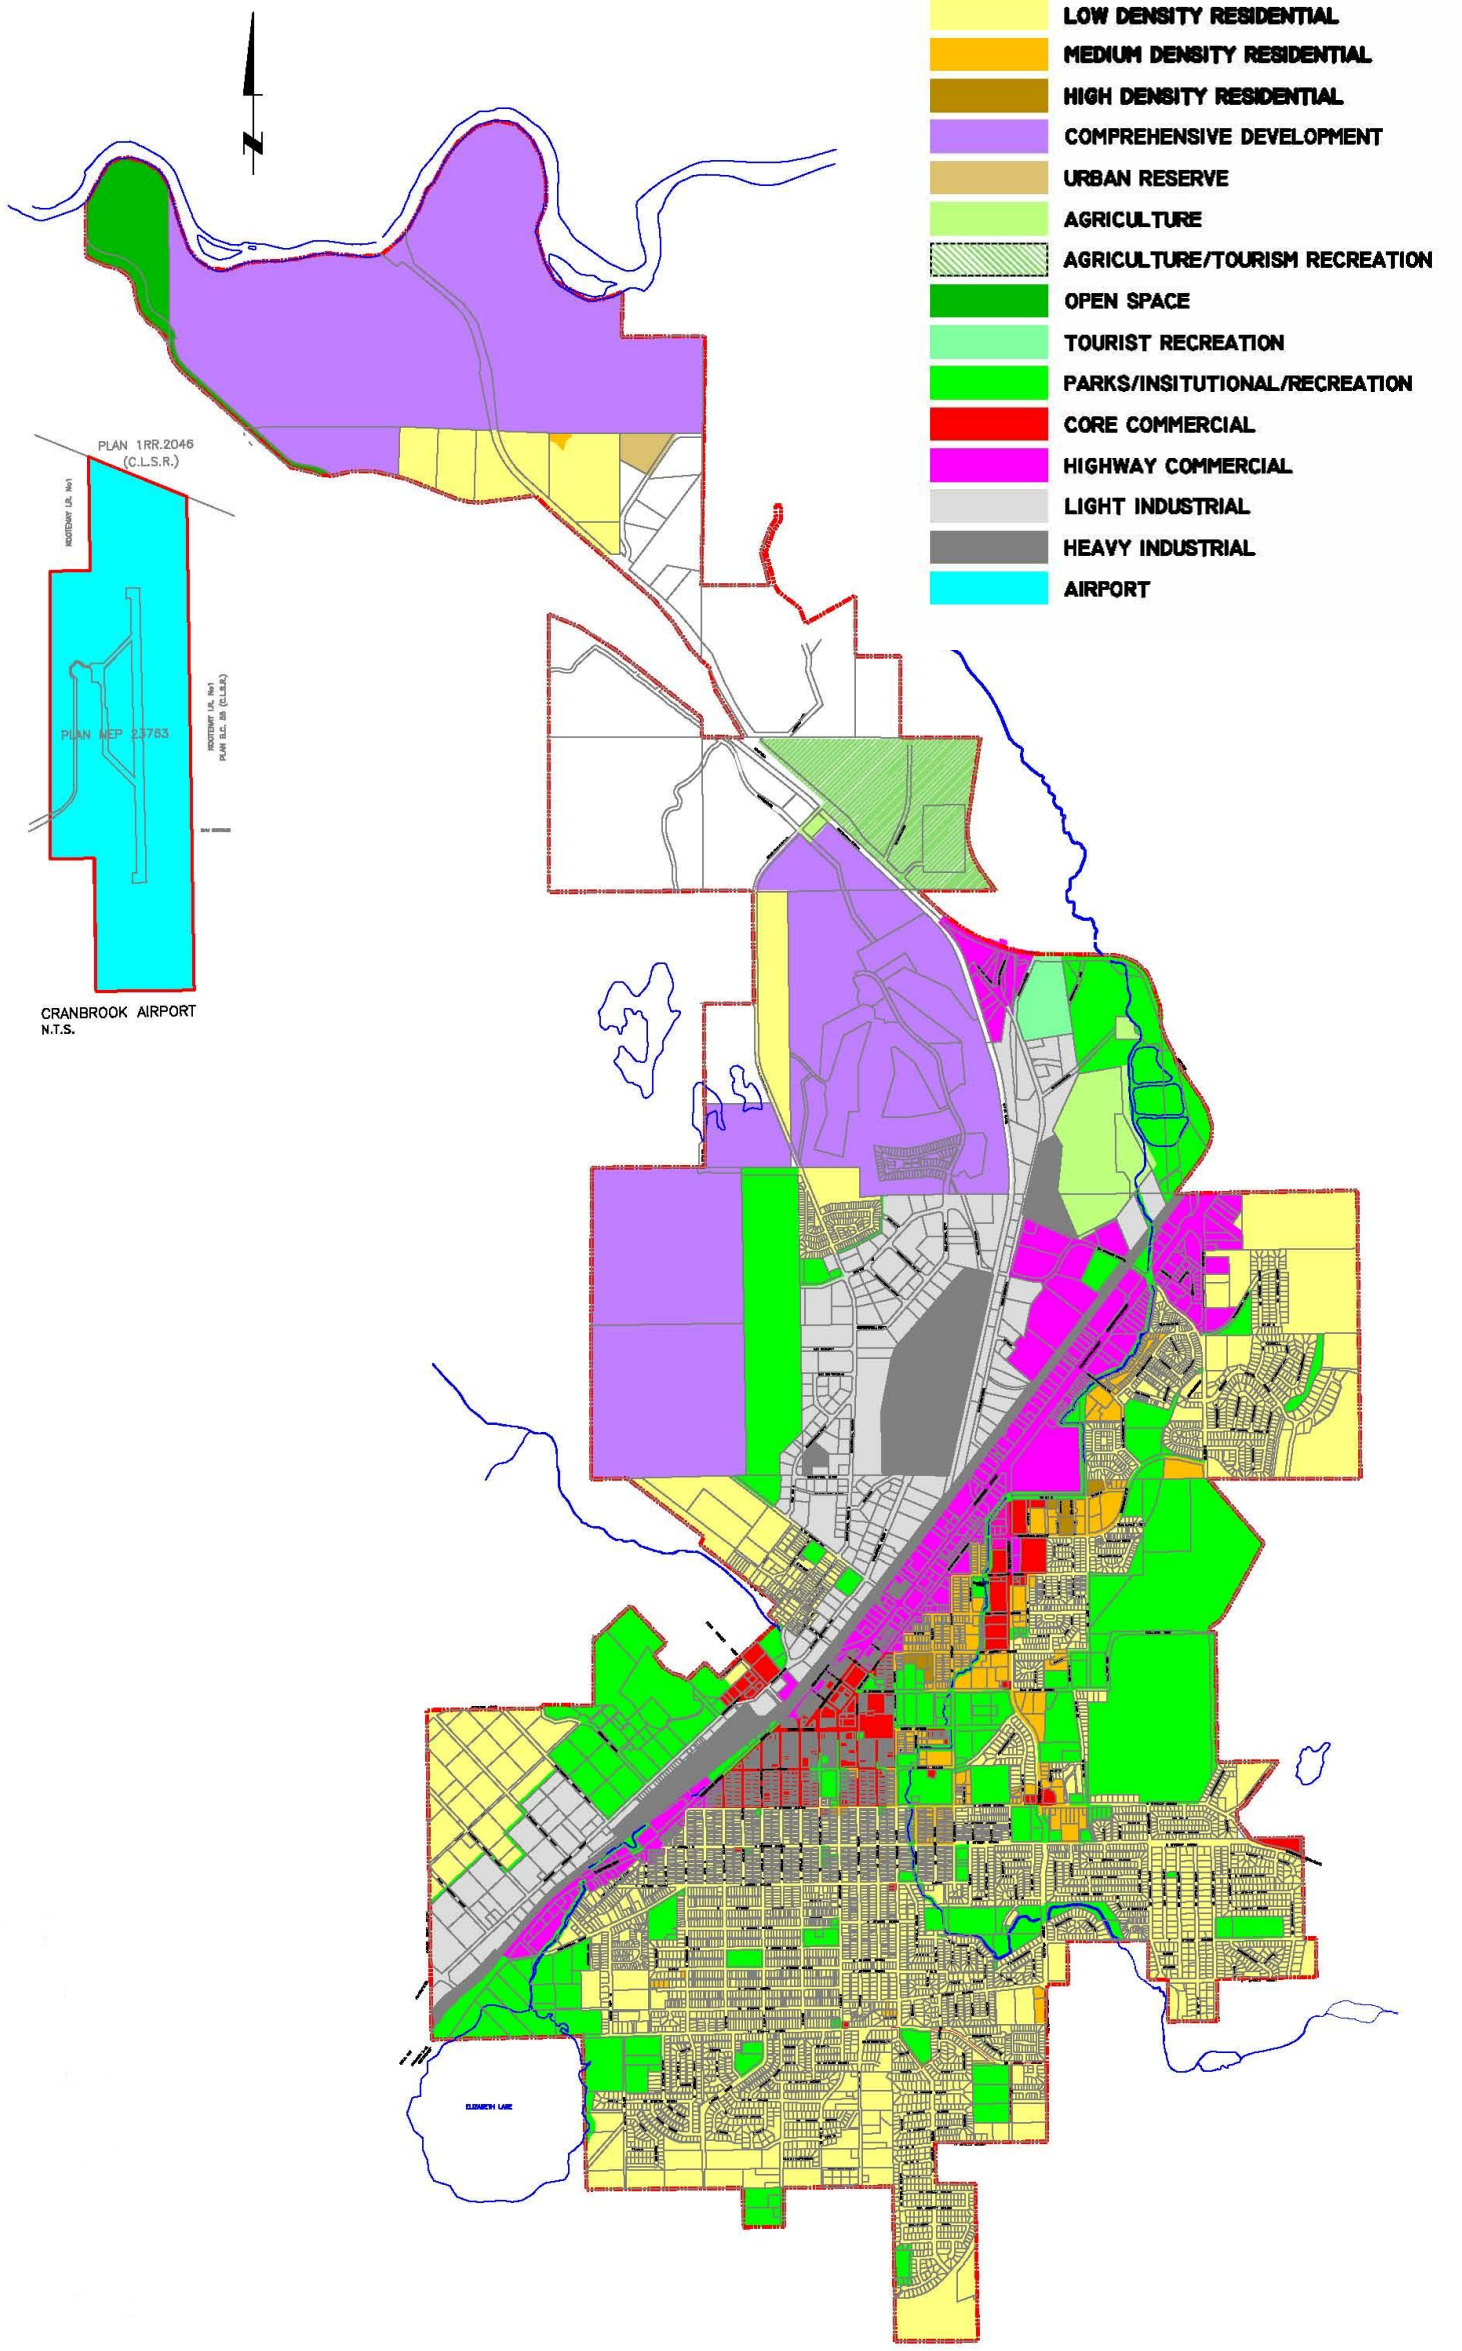
Base year employment data was also primarily based on the federal 2006 census data. Statistics Canada provides employed labour force counts for dissemination areas in Cranbrook. Stantec then disaggregated the employment numbers at the transportation analysis zones based on zone sizes and land use designations shown in the City's updated Official Community Plan (OCP) as illustrated in Figure 4.1.

Given that retail land use has quite different trip generation characteristics, the employment positions were broken down as retail jobs and non-retail jobs. The employment data for each zone was estimated based on the zonal land uses and the employment densities Stantec used for other similar studies (shown in Table 4.2).

Table 4.2
Projected Employment Land Use Density

Land Use Type	Retail Jobs	Non-retail Jobs	Total Jobs
Commercial (per gross ha)	25	10	35
Light Industrial (per gross ha)	1	17	18
Heavy Industrial (per gross ha)	0	10	10
Highway Business/Commercial (per gross ha)	12	13	25
Shopping Mall (per gross ha)	50	85	135
Residential (per capita)	0.03	0.08	0.11

As shown above in Table 4.1, there are a total of 9,717 non-home-based employment positions in the study area, among which 9,589 positions are located in the City, and 128 positions



Stantec

City of Cranbrook Growth Management Study - Transportation Planning

Figure No. 4.1

Title
Official Community Plan

February 2010
1127 20147

outside the City boundary. The breakdown of base year employment data by zone and by type is contained in Appendix B.

Using the above information a non-home based employment to population ratio was calculated. It is estimated that the City of Cranbrook has 0.52 non-home-based employment positions per capita. For the purposes of this study, we assumed this ratio will remain constant as the City grows.

College Student Coding

College of The Rockies has two campuses in Cranbrook and five regional campuses outside Cranbrook offering programs, courses and services. For this study, only the Main Campus located adjacent to College Way in Cranbrook was included, due to its significant impact on Cranbrook transportation system.

Based on the information available from the college's website, it is assumed 1,000 students (approximately 50% of the total full-time equivalent students in the seven campuses) are attending the Cranbrook Main Campus.

4.1.2 Trip Types

Trips taken during the PM peak hour are divided into three basic trip types for the Cranbrook model:

- Home-Based Work (HBW)
- Home-Based Other (HBO)
- Non-Home Based (NHB)

Each of these trip types has different trip characteristics and therefore produces different travel patterns. Because of these differences, they have been divided into groups so that they may be modeled separately. The following sections outline how each trip type is accounted for in the modeling procedure.

Home-Based Work

During the PM peak hour, these trips are primarily generated by the various employment areas and are attracted to the residential areas.

Home-Based Other

During the PM peak hour, these trips are generally attracted to retail/service areas and generated by the residential areas (home based shopping trips), as well as students attracted to home (home based school trips).

Non-Home Based

During the PM peak hour, these trips are generally produced by the employment or college areas and attracted to other employment and retail/service areas.

The allocation of the trip types illustrated in Table 4.3 in the next section summarizes the contribution each land use makes to the three trip types. This allocation is based on industry standards and experience in completing models for other similar small urban areas.

4.1.3 Four-Step Transportation Planning Model

The 4-step transportation planning model is the most common model approach used in regional and municipal transportation planning. The four steps, as stated below, have strong relationship with each other, and usually need an iterative analysis to achieve the best result.

- Trip Generation
- Trip Distribution
- Mode Split
- Trip Assignment

Within the scope of this model development, trip generation refers to private automobile trip generation, and mode split to transit, bicycle, or other modes is not included in this study.

4.2 TRIP GENERATION

Based on the location of trip generators (within or outside the study area), trips can be divided into two categories: internal zone-generated trips and external zone-generated trips.

4.2.1 Internal Zone Trip Generation

To estimate the total trips generated by an internal zone, the trip generation rates for each type of land use need to be determined first.

Trip generation rates are factors that indicate the number of trips that occur in an area for every unit of associated land use. For the City of Cranbrook model the rates have been calculated in vehicle trips per person for residential land uses and vehicle trips per employee for employment land uses.

The residential and employment trip generation rates were established from intersection turning movement and link automatic traffic recorder (ATR) counts, from the ITE trip generation data, and from data compiled for previous transportation models completed by Stantec. Table 4.3 summarizes the trip generation rates recommended for the Cranbrook transportation model.

Table 4.3 - PM Peak Hour Trip Generation Rates

Land Use	Unit	PM Peak Generation Rate	Split		Trip Type Split			Trip Generation Rates					
								HBW		HBO		NHB	
			In	Out	HBW	HBO	NHB	In	Out	In	Out	In	Out
RESIDENTIAL	Person	0.30	65%	35%	40%	60%	0%	0.078	0.042	0.117	0.063	0.000	0.000
EMPLOYMENT													
Retail	Employee	2.05	45%	55%	15%	40%	45%	0.138	0.169	0.369	0.451	0.600	0.323
NHB Retail			65%	35%									
Others	Employee	0.50	30%	70%	40%	30%	30%	0.060	0.140	0.045	0.105	0.045	0.105
EDUCATIONAL													
College	Student	0.22	25%	75%	20%	65%	15%	0.011	0.033	0.036	0.107	0.008	0.025

4.2.2 External Zone Trip Generation

Depending on trip destinations, two types of trips are generated by external zones: external-external trips and external-internal trips.

- External-external trips are commonly called through trips. They are trips that originate in, and are destined to, external zones. They have neither an origin nor destination within the study area.
- External-internal trips are trips that have a trip end in an external zone and the other end in an internal zone.

An estimation of external trips was done based on the 2008 link ATR counts at the major roadways connecting to the external zones, as well as the City's roadway functions.

4.3 TRIP DISTRIBUTION

After the total outbound/inbound trips are generated for each zone, the next step is to estimate trip interchanges between and within traffic zones. In order to match model travel patterns to observed travel patterns, a gravity model was formulated for Cranbrook as follows.

$$f(U_{ij}) = 1/(U_{ij}^{\beta} + C * U_{ij}^{\alpha})$$

Where:

U_{ij} = value of utility (e.g. travel time or distance) between Zone i and Zone j

α, β and C = model parameters, calibrated as described in Section 4.3.2

The basic premise of the gravity model is that the trip-interchange magnitude between two zones is proportional to the trips produced in the origin zone and the trips attracted to the destination zone, and inversely proportional to the travel impedance (travel time) between the two zones.

4.3.1 Travel Time Parameters

Travel times for motorized transport are determined by the level of congestion of links and intersections, reflecting traffic volumes and capacities of these network objects. As such, the travel time between two zones consists of:

- travel times along zone connectors,
- travel times along links, and
- travel times at nodes / intersections.

Connector Travel Time

A connector is a dummy link to connect a zone with the street network. To simulate the traffic along connectors, a 30 km/h speed is used for all zone connectors, and no capacity constraint is considered for connectors. Therefore, the connector travel time can be obtained based on the speed and the connector distance.

For external zone connectors, the travel times to/from activity centers outside the study area were estimated as part of the calibration process to provide greater control over the distribution of internal-external and external-internal trip patterns.

Link Travel Time

Link travel time is the total travel time required for a trip to proceed from one end of a link to the other, which is dependent on the length of the link and the vehicle speed along it. Under free traffic flow, the free flow speed will decide the free flow travel time (t_0). The travel time, however, is calculated as a function of volume and capacity, using a volume delay function (VDF). Cranbrook's Transportation Model utilized the following TModel link VDF to calculate travel time:

$$t_{cur}^{link} = (t_0 + a) * \left[1 + d * \left(sat + f\right)^b\right]$$

$$sat = \frac{vol}{cap * c}$$

Where:

t_0 = free flow link travel time

vol = loaded link traffic volume

cap = directional link capacity

a, b, c, d, f = user-defined parameters.

For the Cranbrook model, two ranges of parameters are recommended, as follows.

- When sat < 0.80: a = 0, b = 3.5, c = 1, d = 0.25, and f = 0.25
- When sat $\geq$ 0.80: a = 0, b = 10, c = 1, d = 0.25, and f = 0.25

The above link delay functions were used for all classes of links. This formula is intended to simulate the effect of congestion on travel time, with increased traffic volumes corresponding to increased travel times.

As a starting point, the posted speed limit was used as the modeled free-flow speed (called V_0Prt in VISUM) to obtain free-flow time (t_0). The actual model free-flow speed, however, was subject to manual adjustment where appropriate to reflect actual travel patterns as closely as

possible. For example, initially the model was assigning less numbers of trips on highway 3/95, whereas traffic counts indicate that trips within the City would be more likely to remain on the highway and urban major roadways. As such, the model free-flow speed along Highway 3/95 was increased to 70 km/h (posted speed limit = 60 km/h).

Node Travel Time

Node travel time relates to permissive turning movements at a node in the model network. Node travel times are used mainly to restrict prohibited movements or to deter movements that are being over-assigned by the model. The VISUM model used a TModel Node VDF to calculate node travel times. The methodology described in VISUM is as follows:

- The TModel Node VDF assumes that each turn delay is the total of node delay and an optional turn-specific delay. A node delay is calculated by applying a volume-delay function to the node volume-capacity ratio. The optional turn-specific delay is used to add additional penalty to some specified turns. For different junction control intersections, VISUM can assign “special” links to restrict that only turns originating from one of these “special” links will have a turn time penalty; and all others have zero turn times. For example, at a two-way stop intersection only minor roads will have node delays.

The formula of the node VDF is shown as follows:

$$t_{cur}^{node} = a + d * (sat + f)^b$$

$$sat = \frac{vol}{cap * c}$$

Where:

vol = loaded total volume entering the node

cap = total capacity of the node

a, b, c, d, f = user-defined parameters

The node delay parameters as defined below were used for all types of intersections.

- When sat < 0.75: a = 1, b = 3.5, c = 1, d = 15, and f = 0.2
- When sat $\geq$ 0.75: a = 1, b = 5, c = 1, d = 15, and f = 0.2

For this study, the optional turn-specific delays are coded for left turn and right turn movements, as shown in Table 4.4. U-turns are not allowed for the model.

Table 4.4
Intersection Turning Movement Delay

Turn Type	Delay (Sec)
Through	0
Left	10
Right	6

Intra-zonal Travel Time

The intra-zonal travel times were incorporated into the model to generate some intra-zonal trips (i.e. those remaining within a zone and not adding to external street network volumes). The formula of the intra-zonal travel time is expressed as follows:

$$t_{intra-zonal} = \sqrt{Area_{Zone}} \div Speed$$

Where:

Area $_{Zone}$: the area of a transportation analysis zone

Speed: model speeds for intra-zonal trips. Since the transportation system is relatively small, a low speed of 7.5 km/h is assumed for this study.

4.3.2 Curve Parameters Calibration

The model was calibrated by adjusting the gravity model curve parameters, Alpha (α), Beta (β) and Const (C) as discussed in Section 4.3, to achieve a reasonable match with ground traffic counts across screenlines, place of residence/place of work commuting data, and external trip making activities.

A screenline is an imaginary line imposed across an area, which divides that area into sections between which trip exchanges are expected to occur. For this model, Highway 3/95 (Cranbrook Street/Van Horne Street) was selected for the screen line analysis.

The resulting Alpha, Beta and Const factors for the three trip types are summarized in Table 4.5.

Table 4.5
Calibration Factors

Trip Type	Alpha	Beta	Const
HBW	-1	1.50	100
HBO	-1.5	2.50	200
NHB	-1.5	2.00	200

4.4 TRIP ASSIGNMENT

The last step of the model is to assign the inter-zonal trips to the road network. In this model, the Multi-Equilibrium Assignment methodology was used, as it can reasonably simulate travel characteristics indicated in Wardrop's first principle:

> *Every road user selects their route in such a way that the travel time on all alternative routes is the same, and that switching to a different route would increase personal travel time (user-optimized behaviour).*

In this method, a state of balance (or equilibrium) in the volume assignments is reached by a multiple-step iteration process. Vehicle assignments shift from among various alternative routes based on changing levels of congestion and travel times as vehicles are added incrementally to the network.

Figure 4.2 shows the base year model volumes in the City of Cranbrook, which indicates the modeled traffic mainly travels along Highway 3/95, 95A, and City major roads such as Victoria Avenue, 14 Avenue, Kootenay Street, etc. This matches the real-world traffic situation very well.

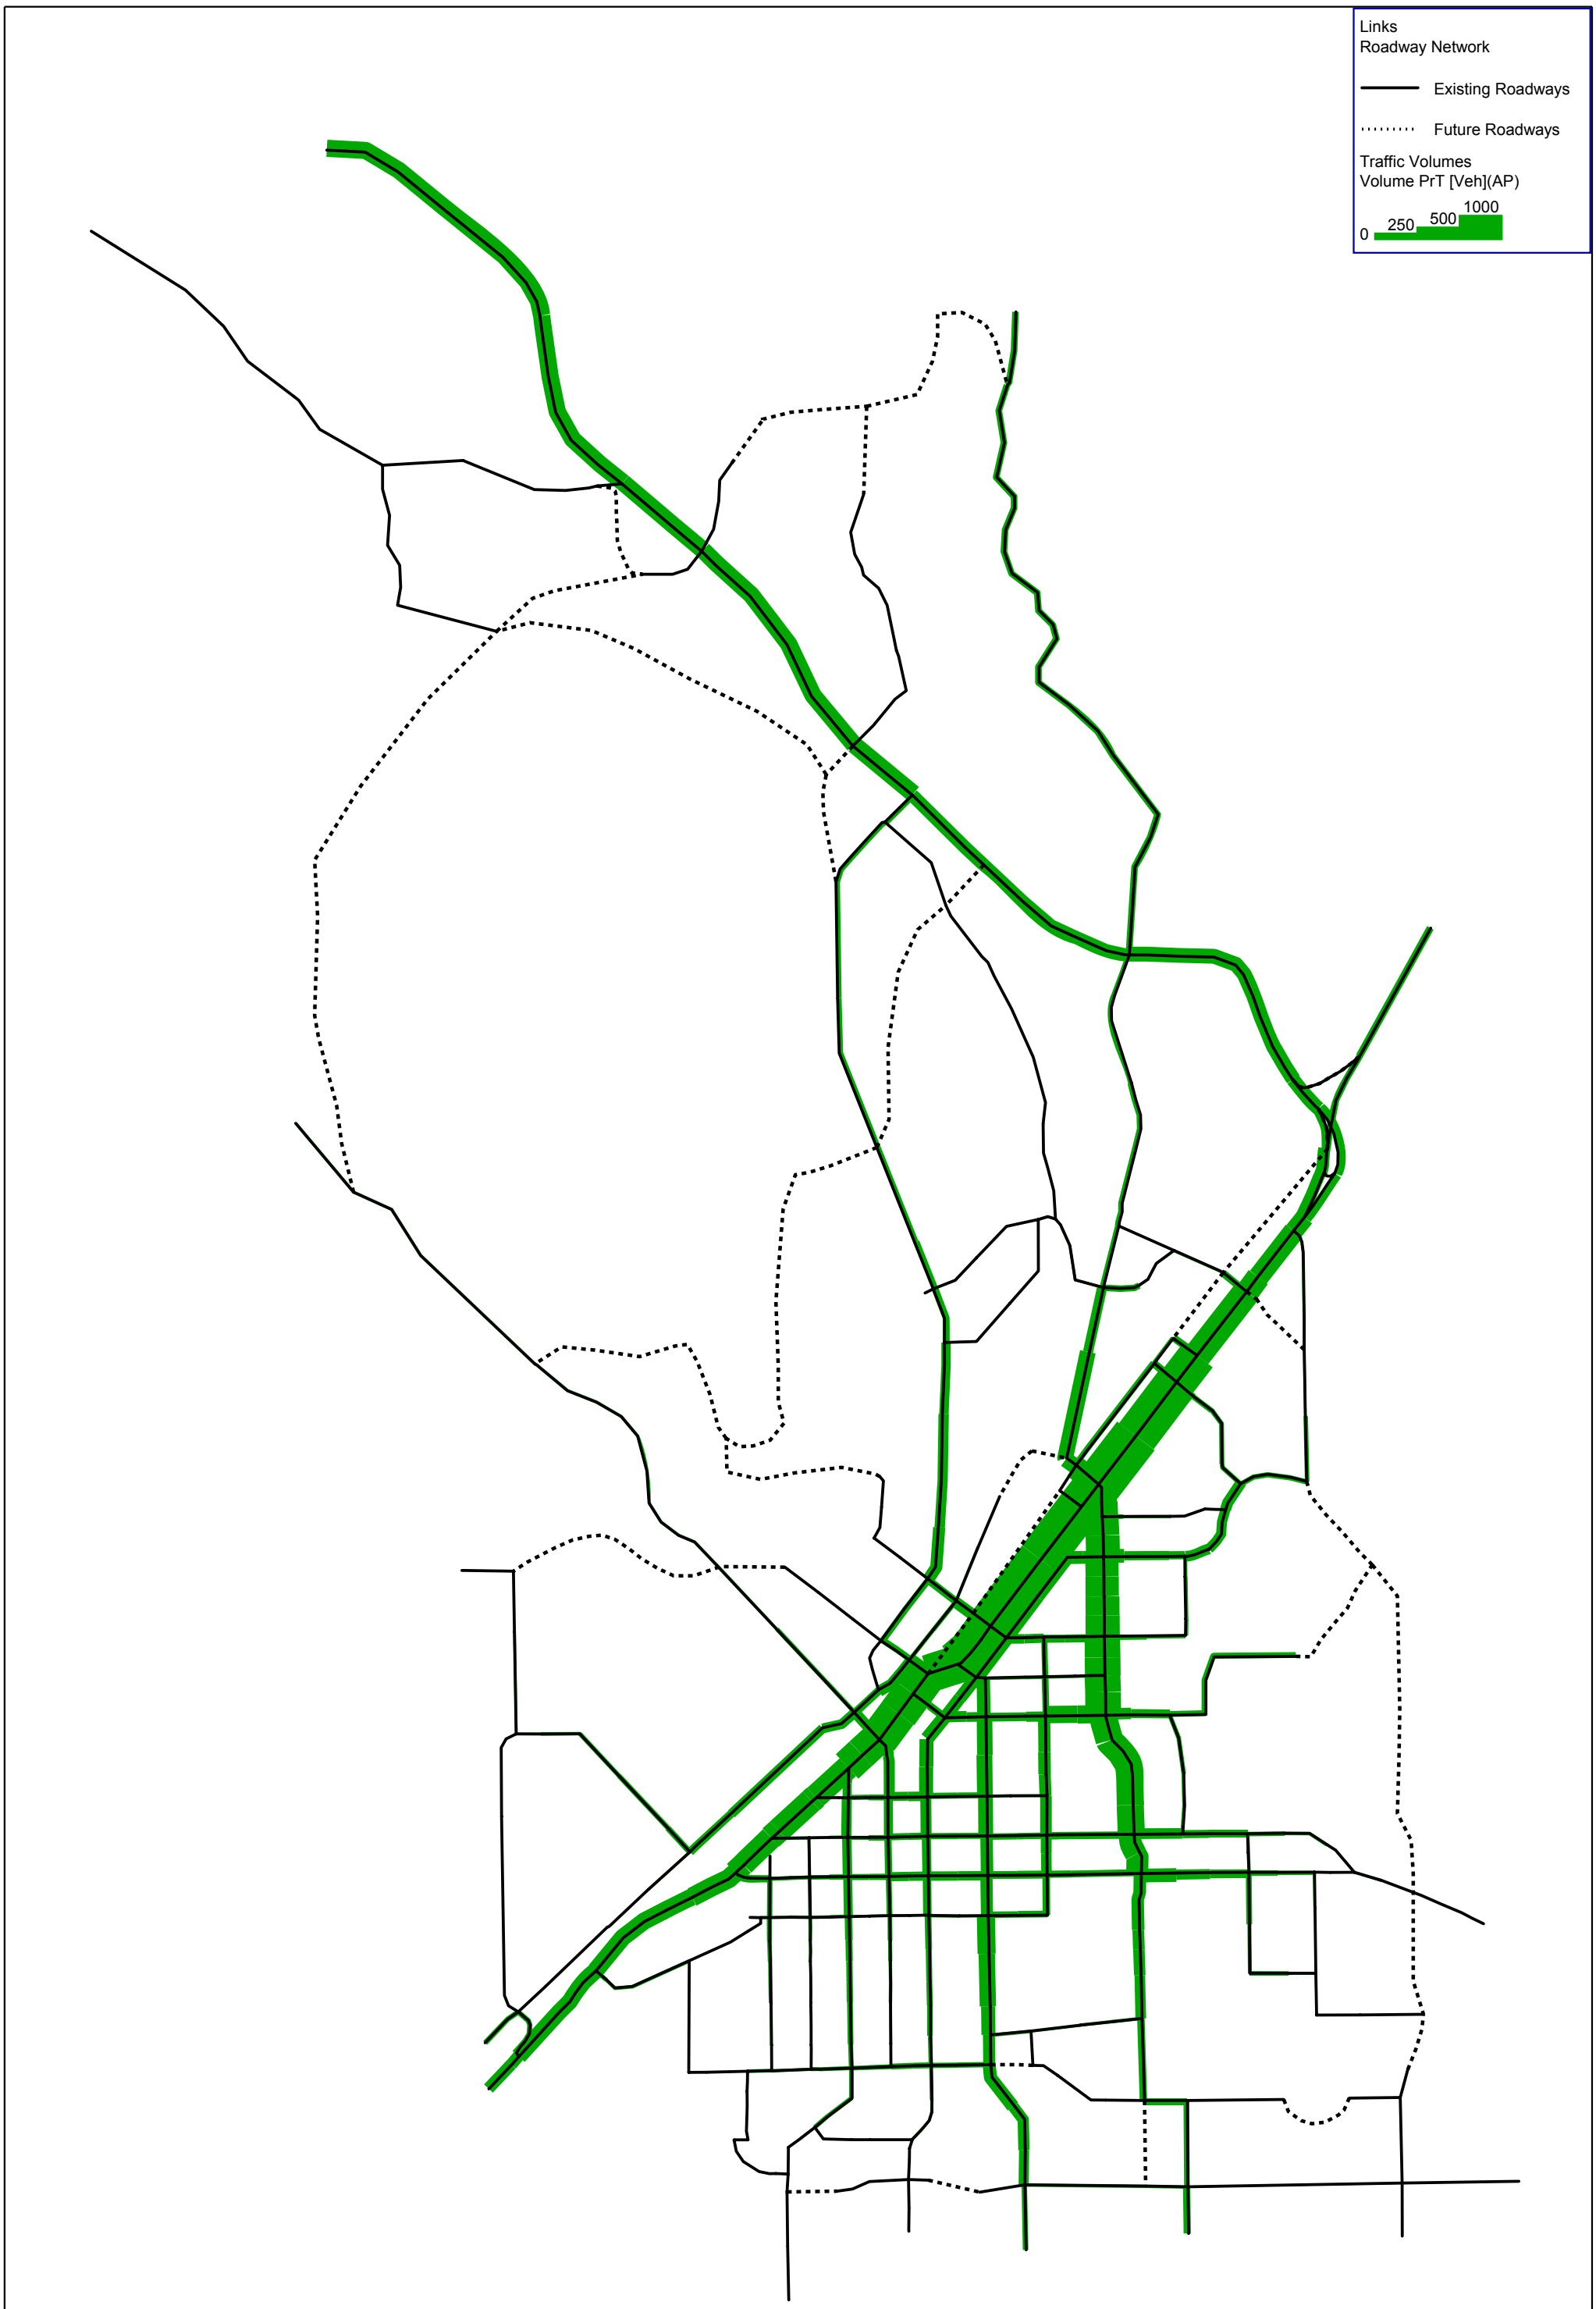
4.5 MODEL VALIDATION

The collected ground traffic counts were used to validate the calibrated base year model.

4.5.1 Screenline Analysis

As mentioned in Section 4.3.2, Highway 3/95 was selected for screenline analysis. Table 4.6 summarizes the analysis result. Based on the criteria adopted by the City of Edmonton[2], the calibration represents a strong correlation between observed volumes and predicted volumes, with both directions of the screenlines falling into the "good" range.

[2] The criteria originated with the City of Edmonton as applied in their regional travel modeling.



VISUM 11.02 PTV AG	Fig 4.2 - Cranbrook Transportation Model PM Peak Hour Traffic Assignment (Base Year)	cranbrook_base year.ver
Date: 04.02.2010	Stantec Consulting Ltd.	Scale: 1:30000

Table 4.6
Screenline Analysis Summary

Screenline	Direction	Model Volumes	Ground Counts	Difference	Goodness of Fit
Highway 3/95	Entering the City southeast of Highway 3/95	1049	1058	-9	Good
Highway 3/95	Leaving the City southeast of Highway 3/95	1095	1010	85	Good

4.5.2 Goodness-of-Fit Analysis

To evaluate the quality of a travel model's calibration, a common method is to compare the calibrated model link volumes with available link traffic counts. Figure 4.3 illustrates the traffic volumes simulated for the base year on the existing roadway network (gray bars) along with thin red or green bars depicting the magnitude of model under- or over-prediction relative to available ground counts.

Figure 4.4 shows the overall model calibration results using a scatter diagram and a linear regression calculation based on tolerances suggested by NCHRP 255[3]. The R^2 (coefficient of determination) shows how well the regression line represents the assigned data. The closer this value is to 1.00, the better the statistical fit. The RMSE (root mean square error) shows the overall difference between traffic counts and model results. As the RMSE approaches 0.00, the model approaches perfect calibration. Generally a model with R^2 greater than 0.80 and RMSE less than 35% can be considered "good".

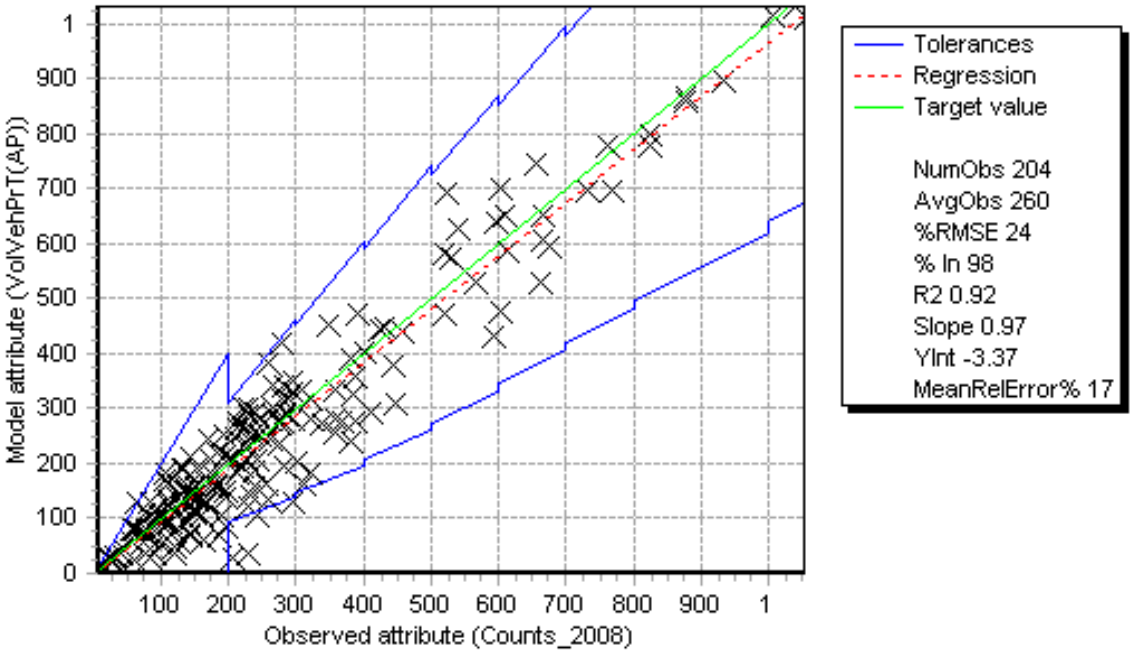
Figure 4.4

Overall Base Year Model Calibration Results



The above figure indicates that this model has an R^2 of 0.92 and a RMSE of 24%. This is considered to be a 'very good' fit.

4.6 ROADWAY CAPACITY ANALYSIS

Typically, link volume-to-capacity (V/C) ratio and intersection level of service (LOS) indicators are used to identify traffic congestion at link and intersection levels, respectively. Given that Cranbrook is a relatively small community, low V/C ratios and good LOS will be acceptable to the City residents. However, with the City grows, it is anticipated that traffic will increase and people will likely get used to more congestion. As such, higher V/C ratios and worse LOS would be acceptable in future horizons. In consultation with the City, a set of critical values are suggested for Cranbrook at current and future horizons. If the model results are higher/worse than the critical values in Table 4.7, roadway improvements will be triggered to reduce the traffic congestion.

Table 4.7
Capacity Analysis Indicator Critical Values

Horizon	Link V/C Ratio	Intersection LOS
Current (Base Year)	0.70	D
Short Term (Year 2016)	0.75	D
Long Term (Current City Boundary Full Build Out)	0.80	E

4.6.1 Link Capacity Analysis

Typically, link volume-to-capacity ratios are used to identify traffic congestion at the link level. The higher the value, the more congestion is experienced by motorists.

Figure 4.5 shows the existing link V/C ratios for Cranbrook. It indicates that the current roadway network works quite well. Except for Victoria Avenue S just north of 3rd Street S (which has a V/C ratio between 60 and 70%, shown in green color), all other roadways have V/C ratios below 60% (shown in grey color).

4.6.2 Intersection Capacity Analysis

At a planning level, VISUM can calculate intersection performance indicators (e.g. level of service) according to the procedures set out in the Highway Capacity Manual (HCM) 2000 edition. When an unsignalized intersection has LOS worse than the “critical values”, a traffic signal is added for further analysis.

Figures 4.6 illustrate the major intersections (major road intersecting highway / other major road) LOS in the City of Cranbrook, based on the ground traffic counts and existing lane geometry.

The model results in the above figures indicate that the intersection at Cranbrook Street (Highway 3/95) with Victoria Avenue North/Theatre Road has the worst LOS of “D”. All other intersections operate at LOS of “C” or better.

5.0 Year 2016 Horizon Model (Short Term)

This horizon is representing a short term (10 year) future timeline for the City of Cranbrook. The objective is to assess if and which improvements are required prior to the 10 year horizon. The horizon year is nominally 2016 (since the base data is from 2006), but it is the population level which best defines the horizon.

5.1 POPULATION AND EMPLOYMENT

Based on the City's Official Community Plan, and growth assumptions identified by Stantec Urban Planners in consultation with City, the proposed land use growth by 2016 is illustrated in Figure 5.1.

5.1.1 Population

Stantec Urban Planners, in consultation with the City, prepared population growth for the year 2016 at the dissemination area level. The distribution of the population to individual traffic analysis zones was estimated based on the future land use map shown in Figure 5.1.

Table 5.1 summarizes the population projections for the year 2016. A breakdown of population estimates by zone is contained in Appendix C.

For the Year 2016 horizon, it is estimated that the population in the City will reach 20,606 people. The total population in the study area including the adjacent areas would be 21,489.

Table 5.1
2016 Horizon Population and Employment

Jurisdiction	Population	Non-home Based Employment Positions	Employment / Population Ratio
City of Cranbrook	20,606	10,730	0.52
Outside the City	883	128	0.14
Total Study Area	21,489	10,858	0.51

5.1.2 Employment

Estimates of future employment positions were based on the assumption that employment / population ratios remain at a similar level to current conditions. As such, the 2016 horizon will include approximately 1,140 additional employment positions within the study area relative to the base year horizon.

CITY OF CRANBROOK
GROWTH MANAGEMENT STUDY
TRANSPORTATION PLANNING

Figure No.
5.1

Title
Land Use Growth
- 2016 Horizon

April 2009
1127 20147

Based on the employment densities as illustrated in Table 4.1 and future land use plan in Figure 5.1, Year 2016 employment positions were estimated for each traffic analysis zone for the same two categories used in the base year model: retail, and non-retail jobs.

Table 5.1 above also includes the 2016 employment position estimates. In total, there are about 10,858 non-home-based employment positions in the study area, among which 10,730 positions are located within the city.

The breakdown of employment positions by type and by zone is included in Appendix C.

5.1.3 College Students

The above 2016 population projection indicates about 12% increase as compared with the 2006 population.

Using the same percentage for the college student population growth, it is assumed the number of students attending the Cranbrook Main Campus will reach 1,120 by 2016.

5.2 EXTERNAL TRIPS

For estimating the external trips at the 2016 horizon, an average annual traffic growth rate of 3% (which is commonly used by BC Ministry of Transportation) was adopted. Therefore, it is assumed the external trips at the major gates to/from the study area will have a total of 30% increase by the 10 year horizon.

5.3 TRAVEL DEMAND FORECASTING

This section outlines the traffic volume projection for the 2016 horizon. Initially the existing road network was used to project traffic at this short-term horizon.

5.3.1 PM Peak Hour Link Volumes

After loading the projected 2016 population and employment positions upon the current roadway network, the VISUM model projects corresponding PM Peak hour traffic volumes.

To minimize calibration error impacts on model forecasts, the model volume projections were calculated by adding the difference between 2016 model volumes and Base Year model volumes to ground traffic counts (where applicable), based on the methodology discussed in NCHRP Report 255.

Figures 5.2(a) and 5.2(b) show the projected peak hour traffic in 2016 for the whole study area and city centre, respectively. As a comparison, the base year peak hour volumes are shown in the figures in red beside the 2016-projected traffic.

5.3.2 Daily Link Volumes

As discussed in Section 2, the daily traffic was calculated by multiplying the PM peak hour traffic by 11.

The projected 2016 daily volumes are shown in Figure 5.3(a) and 5.3(b) for the whole study area and city centre, respectively. Beside the numbers are the estimated Base Year daily traffic volumes for comparison.

The figures indicate that the daily traffic will increase slightly in 2016 as compared with the Base Year Horizon. For example, Highway 3/95/95A will attract major traffic in the City with the daily traffic ranging from 6,900 to 22,800 veh/day in 2016, as compared with 5,600 to 23,100 veh/day in the Base Year. Another major road, Victoria Avenue N and S has daily traffic ranging from 4,400 to 18,100 veh/day in 2016, as compared with 3,500 to 16,500 veh/day in the Base Year.

5.4 ROADWAY CAPACITY ANALYSIS

5.4.1 Link Capacity Analysis

The projected link V/C ratios at the 2016 horizon are illustrated in Figure 5.4, which indicates that the link congestion level will be essentially the same as in the Base Year. Except for the segment of Victoria Avenue S. north of 3rd Street S. (shown in green color with V/C ratio between 65 and 75%), all other roadways will have V/C ratios below 65% (shown in grey color).

5.4.2 Intersection Capacity Analysis

The Intersection Capacity Analysis (ICA) methodology in VISUM was used to again assess the major intersections. It should be noted that the intersection capacity analysis in this study is conducted at a conceptual planning level. Further detailed operation analysis will be required to determine the intersection lane geometry and traffic control types.

Figure 5.5 shows the LOS at major intersections. It indicates these intersections will operate at similar level of service as in Base Year. Except for LOS of “D” at Cranbrook Street (Highway 3/95) with Theatre Road / Victoria Avenue N, all other intersections have LOS of “C” or better.

5.5 ROADWAY IMPROVEMENTS

Based on the above capacity analysis, the current roadway network will likely accommodate the land use growth prior to Year 2016. As such, at a planning level no roadway improvements are recommended at this short term horizon. However, a traffic monitoring program is recommended to monitor the current road and traffic operations, and then to determine appropriate timing of roadway maintenance and upgrades.

6.0 Current City Boundary Full Build Out Model (Long Term)

6.1 POPULATION AND EMPLOYMENT

This horizon represents a long term for the City of Cranbrook. Using an annual population growth rate of 1.2%, this horizon will be likely beyond 50 to 60 years.

Based on the City's Official Community Plan and growth assumptions identified by Stantec Urban Planners and the City, this horizon represents substantial growth in the current city boundary, to the point where population and employment growth is expected to infill all residential and employment lands available for development within the City, including St. Mary Neighborhood and Wildstone comprehensive area at the north.

The projected land use growth plan at the full build-out horizon of the current city boundary is shown in Figure 6.1.

6.1.1 Population

Stantec Urban Planners, in consultation with the City, prepared population growth for this long term horizon at the dissemination area level. The distribution of the population to the individual traffic analysis zones was then estimated based on the future land use map shown in Figure 6.1.

Table 6.1 summarizes the population projections at this long term horizon. A breakdown of population estimates by zone is contained in Appendix D. It is estimated that the population in the City will reach 36,164 people when the available lands within the current city boundary are fully developed. The total population in the study area including the adjacent areas would be 37,162 by then.

Table 6.1
Current City Boundary Full Build Out Horizon Population and Employment

Jurisdiction	Population	Non-home Based Employment Positions	Employment / Population Ratio
City of Cranbrook	36,164	18,502	0.51
Outside the City	998	168	0.17
Total Study Area	37,162	18,670	0.50

Title
Land Use Growth
- Current City Full Build Out Horizon

April 2009
1127 20147

6.1.2 Employment

Estimates of future employment positions were based on the assumption that employment / population ratios remain at a similar level to current conditions. As such, the long term horizon will include approximately 8,918 additional employment positions within the study area.

Based on the employment densities illustrated in Table 4.1 and future land use plan in Figure 6.1, the employment positions by zone at this horizon were estimated for the two categories: retail, and non-retail jobs.

Table 6.1 above includes the employment position estimates used for the long term horizon. In total, there are 18,670 non-home based employment positions in the study area, among which 18,502 positions are located in the current city boundary.

The breakdown of employment positions by type and by zone is included in Appendix D.

6.1.3 College Students

The population at this long term horizon was projected to be almost double of the base year population. Therefore, the number of students attending the Cranbrook Main Campus is assumed also to double, to about 2,000 for the long term horizon.

6.2 EXTERNAL TRIPS

Since this long term horizon is quite far away, using the annual growth rate of 3% for the whole growth period may be too conservative. Recognizing the population will almost double the base year, a total of 110% traffic increase is assumed for this horizon (i.e. 2% annual growth rate used for 55 years).

6.3 TRAVEL DEMAND FORECASTING AND CAPACITY ANALYSIS

This section outlines traffic volume projections for this long term horizon. In order to illustrate roadway capacity constraints at this horizon, the base year road network was loaded with traffic projected from the full build out of current city land uses.

6.3.1 PM Peak Hour Link Volumes and Capacity Analysis _ Base Year Road Network

After loading the projected population and employment positions upon the current roadway network, the VISUM model projects corresponding PM Peak hour traffic volumes.

To minimize calibration error impacts on model forecasts, the model volume projections were calculated by adding the difference between this long term model volumes and Base Year model volumes to ground traffic counts (where applicable).

Figure 6.2 shows the projected peak hour traffic in the full build out of the current city boundary. Figure 6.3 shows the link V/C ratios in the study area. These figures indicate that a number of

DesignVols

VISUM 11.02 PTV AG	Fig 6.3 - Cranbrook Transportation Model Link V-C Ratios (Current City Full Build Out)	cranbrook_current city bound
Date: 05.02.2010	Stantec Consulting Ltd.	Scale: 1:30000

roadways will handle high traffic. Without improvement, these roadways will become very congested (shown in yellow or red colors in Figure 6.3). Specifically,

- Highway 95A between Wycliffe Park Road and Mission Road, as well as the Highway 95A ramp to Kimberley at Fort Steel Interchange.
- Theatre Road north of Cranbrook Street N
- Industrial Road No. 2 northwest of 6th Street N
- 3rd Street N between Slater Road and Cranbrook Street N
- 2nd Street N just west of Victoria Avenue N
- Victoria Avenue S just north of 3rd Street S

All the above road segments have projected V/C ratios exceeding 0.80 at this long term horizon. Roadway improvements will be required to mitigate the congestion issues.

6.3.2 PM Peak Hour Link Volumes and Capacity Analysis _ Recommended Road Network

In order to explore an ideal future roadway network, the Major Road Network Plan (shown as Schedule H in the City's Official Community Plan, and also contained in Appendix E) was first incorporated into the VISUM model. Thereafter iterative model operations and fine-tuning roadway improvements were conducted until all the roadways and intersections meet the standards shown in Table 4.7, and a maximum capacity of 10,000 veh/day assumed for a two-lane roadway in Cranbrook.

A recommended roadway network including signalized intersections is thereafter developed and shown in Figure 6.4.

<u>PM Peak Hour Link Volumes</u>

After loading the projected population and employment positions upon the recommended roadway network, the VISUM model projects corresponding PM Peak hour traffic volumes.

Similarly the model volume projections were calculated by adding the difference between the long term model volumes and the base year model volumes to ground traffic counts (where applicable), to minimize calibration error impacts on model forecasts.

Figures 6.5(a) and 6.5(b) show the projected peak hour traffic at this horizon for the whole study area and city centre, respectively. As a comparison, the base year peak hour volumes are shown in the figures in red beside the projected traffic.

Daily Link Volumes

Using the same scaling factor of 11 discussed in Section 5.3.2, the daily volumes at this long-term horizon were projected and shown in Figures 6.6(a) and 6.6(b) for the whole study area and city center, respectively. As a comparison, the base year daily traffic is also shown in these figures.

With the proposed roadway improvements illustrated in Figure 6.4, Highway 3/95 will still handle the major traffic in the City with the daily volumes ranging from 11,000 to 26,600 veh/day. Another major road, Victoria Avenue will attract daily traffic up to 20,000 veh/day.

Roadway Capacity Analysis

- Link Capacity Analysis

Figure 6.7 illustrates the link V/C ratios at this long term horizon. It indicates all the roadways will operate under acceptable level of service, with the highest V/C ratio of 0.74 at Highway 3/95 into Cranbrook at the Fort Steel Interchange.

- Intersection Capacity Analysis

Using the Intersection Capacity Analysis (ICA) methodology, the LOS at the major intersections was calculated and is shown in Figure 6.8. With appropriate intersection treatments (e.g. adding turning bays and/or installing traffic signals), all the major intersections will operate acceptably with LOS of “E” or better.

6.4 ROADWAY RECOMMENDED IMPROVEMENTS

The recommended roadway plan for this long term horizon should be developed in a staged manner as traffic volumes and levels of congestion warrant the individual improvement measures. According to the work scope of this project, the following only summarizes the recommended roadway improvements prior to the full build out of current city boundary.

Figure 6.9 illustrates the recommended improvements in the City to accommodate the projected traffic volumes prior to the long term horizon. Table 6.2 summarizes the specific recommended improvements. Please note the number in the figure and the following table is for index only and not for priority sequence.

The approximate order of magnitude cost for each improvement is also included in the table. To develop the cost estimates for the recommended roadway network, unit prices per type of improvement were developed based on our previous projects in Okanagan area in BC. These costs include engineering and contingency, but do not include any allowance for major utility works, property acquisition or environmental measures to protected watercourses.

Table 6.2
Roadway Recommended Improvements (Current City Full Build Out Horizon)

Recommended Improvement	Unit Price ($2008)	Quantity	Approx. Cost ($2008)
1. Twin Highway 3/95 north of Fort Steel Interchange and south of Jim Smith Lake Road within the City	$ 3,800	7,650 m	$ 29.07 M
Install traffic signals between Theatre Road/Mission Road and Mountain View Road/Parnoby Road	$ 200,000	4	$ 0.8 M
2. Upgrade Theatre Road to be 4-lane undivided roadway from Cranbrook Street to Highway 3/95	$ 2,700	2,850 m	$ 7.70 M
Install a traffic signal at MCPhee Road	$ 200,000	1	$ 0.20 M
3. Upgrade Van Horne Street to be 4-lane undivided roadway from 12 Street N to north of Willowbrook Drive	$ 2,700	840 m	$ 2.27 M
Construct 4-lane undivided roadway for Van Horne Street from north of Willowbrook Drive to 22 Street N, and from 6 Street NW to 22 Street N	$ 2,900	1,290 m	$ 3.74 M
Construct 2-lane undivided roadway for Van Horne Street from 22 Street N to Highway 3/95 Ramp, and from 3 Street S to 6 Street NW	$ 1,900	1,200 m	$ 2.28 M
4. Upgrade 6 Street NW to be 4-lane undivided roadway from Kootenay Street N to north of Industrial Road No.3	$ 2,700	840 m	$ 2.27 M
Construct 4-lane undivided roadway for 6 Street NW north of Industrial Road No.3	$ 2,900	1,290 m	$ 3.74 M
Install traffic signals at Industrial Road No.1 and Kootenay Street N with 6 Street NW	$ 200,000	2	$ 0.40 M
5. Upgrade 14 Avenue S. to be 4-lane undivided roadway from 2nd Street N. to 1 Street S	$ 2,700	400 m	$ 1.08 M
6. Construct a new 2-lane undivided roadway north of 6 Street NW from King Street W. to Highway 3/95	$ 1,900	5,020 m	$ 9.54 M
7. Construct/extend existing 2-lane undivided roadway of Mountain View Road/Parnoby Road from King Street W to Mission Road	$ 1,900	7,140 m	$ 13.57 M

8. Construct/extend existing 2-lane undivided roadway of Echo Field Road to connect Mountain View Road and Kennedy Road at Highway 3/95	$ 1,900	2,660 m	$ 5.05 M
9. Construct/extend existing 2-lane undivided roadway of 3 Street NW to connect Cross Road NW	$ 1,900	1,470 m	$ 2.79 M
10. Construct/extend existing 2-lane undivided roadway of Industrial Road No.1 to connect Theatre Road	$ 1,900	470 m	$ 0.89 M
11. Construct/extend existing 2-lane undivided roadway of 22 Street N to connect 30 Avenue N	$ 1,900	420 m	$ 0.80 M
12. Construct/extend existing 2-lane undivided roadway of 34 Avenue S to connect 30 Avenue N	$ 1,900	3,200 m	$ 6.08 M
13. Construct/extend existing 2-lane undivided roadway of College Way to connect 30 Avenue N	$ 1,900	640 m	$ 1.22 M
14. Construct/extend existing 2-lane undivided roadway of 13 Street S between 24 Avenue S and 34 Avenue S	$ 1,900	450 m	$ 0.86 M
15. Construct/extend existing 2-lane undivided roadway of Victoria Avenue S to connect to 17 Street S	$ 1,900	430 m	$ 0.82 M
16. Construct/extend existing 2-lane undivided roadway of 11 Street S between 14 Avenue S and 16 Avenue S	$ 1,900	210 m	$ 0.40 M
17. Construct/extend existing 2-lane undivided roadway of 17 Street S east of 4 Avenue S and west of 14 Ave S	$ 1,900	520 m	$ 0.99 M
18. Upgrade Industrial Road No.2 to be 4-lane undivided roadway from 6 St north to a new road (Item #6)	$ 2,700	2,300 m	$ 6.21 M
19. Upgrade Victoria Avenue S to be 4-lane divided roadway north of 3 Street S	$ 3,000	110 m	$ 0.33 M
20. Upgrade 2 Street N to be 4-lane undivided roadway from Victoria Avenue N to 17 Avenue N	$ 2,700	300 m	$ 0.81 M
21. Remove the connection of Echo Field Road with Highway 3/95	$ 200	130 m	$ 0.03 M
22. Remove the connection of Mycliffe Park Road with Highway 3/95	$ 200	600 m	$ 0.12 M
Total			**$104.04 M**

6.5 FUNDING FOR OTHER TRANSPORTATION SYSTEMS

The above section (Section 6.4) discusses the recommended roadway improvements and corresponding cost to accommodate auto vehicles only at the full build out of the current city boundary horizon. Funding for other transportation systems including transit, bicycle, pedestrian, rail and air transportation systems should be explored and allocated.

7.0 Beyond Current City Boundary Full Build Out (Longer Term)

Prior to a referendum in November 2009, the City of Cranbrook was considering expansion for future development beyond the full build out of the existing city boundary. As one potential option, the area east of the city boundary had been considered by the City and discussed with the public. This section, at a very general level, addresses a potential land use plan proposed during the course of this study and its traffic impacts.

7.1 LAND USE AND ROADWAY NETWORK CONCEPT PLAN

Due to the lack of information forthcoming from the expansion area landowners and urban planners/consultants at the time, Stantec was requested to prepare a very high and general level forecast of the potential development for the eastern boundary expansion area, based on Cranbrook Municipal Boundary Extension Application Report prepared by the City in December 2007.

The conceptual urban framework is included in Appendix F. The planned new expansion area would be mainly residential land use plus small amount of commercial, institutional, business office and resort/golf land uses.

A total of three external accesses would have been provided for the east expansion area: two transportation corridors connecting to the existing city plus one access to Highway 3/93 in the east.

7.2 TRAFFIC IMPACT DISCUSSION

Based on the conceptual urban framework for the east expansion area, a high- level traffic review was conducted. The key findings are summarized below:

- The significant residential development would have generated major population growth (as compared with the existing city). However, due to the lack of employment lands proposed in the east expansion area, a large portion of the population would have to work outside of the Area, including the existing city and adjacent municipalities. In other words, a large amount of external trips would have been generated by the east expansion area.

- Since only three external accesses/corridors (two connecting to the existing city plus one connecting to Highway 3/93) were proposed for the east expansion area development, the projected traffic along the two transportation corridors would have been very high, about double of the existing traffic along the Highway 3/95 corridor within the City.

- Based on the principles of sustainable growth development, the reviewed land use and roadway conceptual plan for the east expansion area may be not a good approach, since less proportional employment development will encourage more and long-journey external trips. The limited external accesses also reduce roadway connectivity and limit traffic mobility.

For a more sustainable development, the following recommendations could be made relative to any future expansion area:

- Appropriately plan residential and employment land uses in the expansion area to a similar level of the employment and population proportion in the existing city. More commuting trips staying in the expansion area is preferred.

- Add more accesses/corridors to the existing city and the adjacent highways to increase roadway connectivity and improve traffic mobility.

TRANSTECH DATA SERVICES
Vehicle Turning Movement Survey
Without Classification

Major Route: Kootenay Street
Minor Route: 6th St North
Municipality: Cranbrook
Filename: Kootenay@6thStNorth.xls
Location #: 12

Date: June 26, 2008
Day-of-week: Thursday

East/West Route: 6th St North
Intersection Type: Four approach intersection
Signalized?: No
Weather: Overcast and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments: 7:49 to 7:58 Traffic backed up on all Legs (vehicles passing stopped vehicles and proceeding into the wrong lane) 8:25 to 8:32 Setup construction site on Kootenay NL with flagger. 2 peds almost hit. 4 near-miss accidents. Many 2nd car follow-thrus . Road markings very poor.

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

TRANSTECH DATA SERVICES
Vehicle Turning Movement Survey
Without Classification

Major Route: Route 3-95
Minor Route: 2nd St South
Municipality: Cranbrook
Filename: Route3-95@2ndStSouth.xls
Location #: 22

Date: June 25, 2008
Day-of-week: Wednesday

East/West Route: 2nd St South
Intersection Type: Three approach intersection - East Tee
Signalized?: No
Weather: Clear and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments:

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

TRANSTECH DATA SERVICES
Vehicle Turning Movement Survey
Without Classification

Major Route: Route 3-95
Minor Route: 22nd Street
Municipality: Cranbrook
Filename: Route3-95@22nd.xls
Location #: 4

Date: June 25, 2008
Day-of-week: Wednesday

East/West Route: 22nd Street
Intersection Type: Three approach intersection - West Tee
Signalized?: Yes
Weather: Clear and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments:

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

TRANSTECH DATA SERVICES
Vehicle Turning Movement Survey
Without Classification

Major Route: Route 3-95
Minor Route: King Street
Municipality: Cranbrook
Filename: Route3-95@King.xls
Location #: 18

Date: June 26, 2008
Day-of-week: Thursday

East/West Route: Route 3-95
Intersection Type: Four approach intersection
Signalized?: Yes
Weather: Overcast and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments: There were 6 red lights run on the Hwy, 3 in the AM, 3 in the PM and 4 of them where semi's.
Train crossing at 7:49 to 7:55, 16:38 to 16:48, 16:57 to 17:06 and 17:12 to 17:19.

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

Major Route: Route 3-95
Minor Route: Theatre Road
Municipality: Cranbrook
Filename: Route3-95@Theatre.xls
Location #: 6

Date: June 25, 2008
Day-of-week: Wednesday

East/West Route: Route 3-95
Intersection Type: Four approach intersection
Signalized?: Yes
Weather: Clear and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments: Between 16:00 to 17:15 south approach left turn lane had a 2 to 4 light queue.

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

TRANSTECH DATA SERVICES
Vehicle Turning Movement Survey
Without Classification

Major Route: Route 3-95
Minor Route: Wattsville Road
Municipality: Cranbrook
Filename: Route3-95@Wattsville.xls
Location #: 24

Date: June 25, 2008
Day-of-week: Wednesday

East/West Route: Wattsville Road
Intersection Type: Three approach intersection - East Tee
Signalized?: No
Weather: Overcast and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments:

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

TRANSTECH DATA SERVICES
Vehicle Turning Movement Survey
Without Classification

Major Route: Route 95A
Minor Route: Echo Field Road
Municipality: Cranbrook
Filename: Route95A@EchoField.xls
Location #: 1

Date: June 24, 2008
Day-of-week: Tuesday

East/West Route: Route 95A
Intersection Type: Three approach intersection - South Tee
Signalized?: No
Weather: Clear and dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments:

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

Major Route: Route 95A
Minor Route: Theatre Road
Municipality: Cranbrook
Filename: Route95A@Theatre.xls
Location #: 2

Date: June 26, 2008
Day-of-week: Thursday

East/West Route: Route 95A
Intersection Type: Four approach intersection
Signalized?: No
Weather: Overcast and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments:

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

TRANSTECH DATA SERVICES
Vehicle Turning Movement Survey
Without Classification

Major Route: Slater Road
Minor Route: 6th St North
Municipality: Cranbrook
Filename: Slater@6thStNorth.xls
Location #: 13

Date: June 24, 2008
Day-of-week: Tuesday

East/West Route: 6th St North
Intersection Type: Four approach intersection
Signalized?: No
Weather: Overcast and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments: During day a lot of cars made rolling stops and some made no stop at all. Many do not observe 4-way procedure.

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

TRANSTECH DATA SERVICES
Vehicle Turning Movement Survey
Without Classification

Major Route: Theatre Road
Minor Route: McPhee Road
Municipality: Cranbrook
Filename: Theatre@McPhee.xls
Location #: 3

Date: June 24, 2008
Day-of-week: Tuesday

East/West Route: McPhee Road
Intersection Type: Four approach intersection
Signalized?: No
Weather: Overcast and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments: Traffic travelling from south to west have a difficult time turning left. Most traffic turning left onto McPhee cut into the left turning lane. Heavy Trucks proceed out of Esso Card Lock onto Theatre making left turns for those turning left from McPhee tricky.

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

TRANSTECH DATA SERVICES
Vehicle Turning Movement Survey
Without Classification

Major Route: Victoria Avenue
Minor Route: 2nd St North
Municipality: Cranbrook
Filename: Victoria@2ndStNorth.xls
Location #: 8

Date: June 26, 2008
Day-of-week: Thursday

East/West Route: 2nd St North
Intersection Type: Four approach intersection
Signalized?: Yes
Weather: Overcast and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments:

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

TRANSTECH DATA SERVICES
Vehicle Turning Movement Survey
Without Classification

Major Route: Victoria Avenue
Minor Route: 2nd St South
Municipality: Cranbrook
Filename: Victoria@2ndStSouth.xls
Location #: 9

Date: June 24, 2008
Day-of-week: Tuesday

East/West Route: 2nd St South
Intersection Type: Four approach intersection
Signalized?: Yes
Weather: Overcast and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments:

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

TRANSTECH DATA SERVICES
Vehicle Turning Movement Survey
Without Classification

Major Route: Victoria Avenue
Minor Route: 13th St South
Municipality: Cranbrook
Filename: Victoria@13thStSouth.xls
Location #: 10

Date: June 26, 2008
Day-of-week: Thursday

East/West Route: 13th St South
Intersection Type: Four approach intersection
Signalized?: No
Weather: Overcast and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments: 80% vehicles on West approach run the stop sign.

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

Without Classification

Major Route: Victoria Avenue
Minor Route: Kootenay Street
Municipality: Cranbrook
Filename: Victoria@Kootenay.xls
Location #: 7

Date: June 24, 2008
Day-of-week: Tuesday

East/West Route: Kootenay Street
Intersection Type: Four approach intersection
Signalized?: Yes
Weather: Overcast and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments:

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

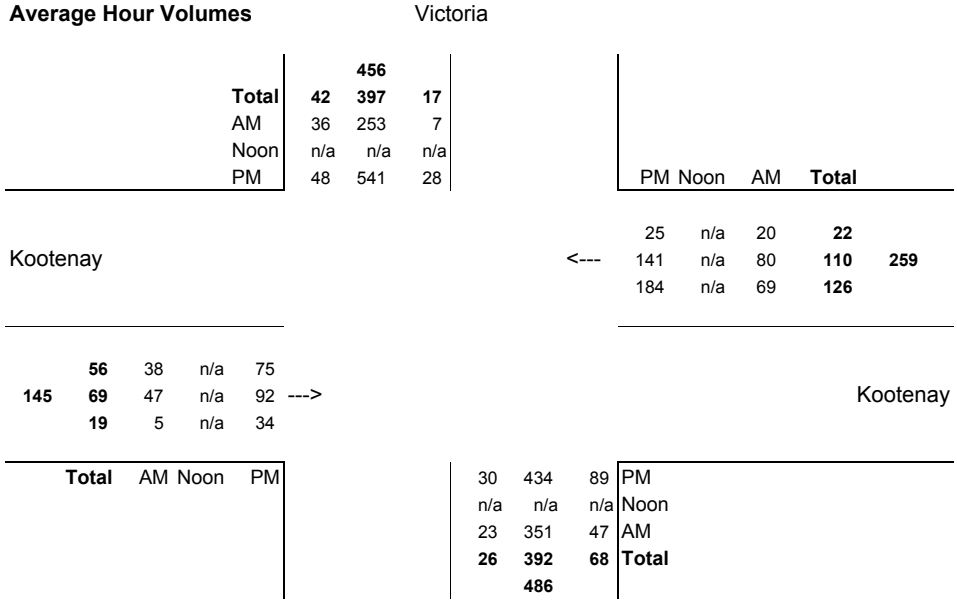
Average Hour Volumes



TRANSTECH DATA SERVICES
Vehicle Turning Movement Survey
Without Classification

Major Route: 7th Ave South
Minor Route: 2nd St South
Municipality: Cranbrook
Filename: 7thAveSouth@2ndStSouth.xls
Location #: 20

Date: June 24, 2008
Day-of-week: Tuesday

East/West Route: 2nd St South
Intersection Type: Four approach intersection
Signalized?: No
Weather: Overcast and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments: Speeding each way on 7th Ave and queuing on 2nd in the PM. Pedestrians have hard time crossing 7th as cars do not stop without a crosswalk.

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

Major Route: 7th Ave South
Minor Route: 11th St South
Municipality: Cranbrook
Filename: 7thAveSouth@11thStSouth.xls
Location #: 21

Date: June 26, 2008
Day-of-week: Thursday

East/West Route: 11th St South
Intersection Type: Four approach intersection
Signalized?: No
Weather: Overcast and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments:

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

TRANSTECH DATA SERVICES
Vehicle Turning Movement Survey
Without Classification

Major Route: 11th Ave South
Minor Route: 2nd St South
Municipality: Cranbrook
Filename: 11thAveSouth@2ndStSouth.xls
Location #: 16

Date: June 25, 2008
Day-of-week: Wednesday

East/West Route: 2nd St South
Intersection Type: Four approach intersection
Signalized?: No
Weather: Clear and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments:

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

TRANSTECH DATA SERVICES
Vehicle Turning Movement Survey
Without Classification

Major Route: 14th Ave South
Minor Route: 2nd St South
Municipality: Cranbrook
Filename: 14thAveSouth@2ndStSouth.xls
Location #: 14

Date: June 25, 2008
Day-of-week: Wednesday

East/West Route: 2nd St South
Intersection Type: Four approach intersection
Signalized?: Yes
Weather: Clear and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments:

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

TRANSTECH DATA SERVICES
Vehicle Turning Movement Survey
Without Classification

Major Route: 14th Ave South
Minor Route: 17th St South
Municipality: Cranbrook
Filename: 14thAveSouth@17thStSouth.xls
Location #: 19

Date: June 26, 2008
Day-of-week: Thursday

East/West Route: 17th St South
Intersection Type: Four approach intersection
Signalized?: No
Weather: Overcast and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments:

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

TRANSTECH DATA SERVICES
Vehicle Turning Movement Survey
Without Classification

Major Route: Cobham Avenue
Minor Route: King Street
Municipality: Cranbrook
Filename: Cobham@King.xls
Location #: 17

Date: June 24, 2008
Day-of-week: Tuesday

East/West Route: Cobham Avenue
Intersection Type: Four approach intersection
Signalized?: No
Weather: Overcast and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments:

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

Major Route: Cobham Avenue
Minor Route: Patterson Street
Municipality: Cranbrook
Filename: Cobham@Patterson.xls
Location #: 23

Date: June 25, 2008
Day-of-week: Wednesday

East/West Route: Patterson Street
Intersection Type: Three approach intersection - West Tee
Signalized?: No
Weather: Overcast and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments:

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

East/West Route: Industrial No.G Road
Intersection Type: Four approach intersection
Signalized?: No
Weather: Overcast and Dry

Vehicle Classifications: All Vehicles **This data is for All Vehicles**

Shift	Start	Duration	End
AM	7:00	2.00	9:00
Noon			
PM	16:00	2.00	18:00
	Total	4.00	

Note: duration: decimal hours
start time: 24 hr clock (15 min increments)

Comments: Many rolling stops ERT and WRT. Last interval many cars going into Moir Park Sports Fields.

Notes: North Approach - southbound vehicles approaching intersection from the north
15x4 - 15 min volume (from maximum 15 minute period of movement/approach in peak hour period [*]) x 4
Pedestrians - N indicates pedestrians crossing north approach (east/west)

Survey Data

Location: Industrial No.2 Road @ Industrial No.G Road
